FORMING A COMPLETE RECORD OF THE PROCEEDINGS OF ALL PUBLIC COMPANIES.

No. 483.—Vol. XIV.] LONDON: SATURDAY, NOVEMBER 23, 1844. [Price 6d.

SHARES IN VALUABLE BRITISH MINES, PAYING DIVIDENDS, AND ADAPTED FOR INVESTMENT.

MR. C. WARTON begs to announce that his NEXT SALE, BY AUCTION, of MINING PROPERTY, will take place at the Mart, London, on Wednesday, the 27th of November, at Twelve o'clock, and will include SHARES in Trethellan, East Pool, Wheal Providence, Levant, the Prestatyn Mines, West Cardon, Geonamon, Craddock Moor, East Cardon, Tokenbury, South Tyeland, Wheal Sisters, Wheal Hope, Cardon Mines, Wheal Penrose, St. Austell Consols, and Wheal Mary Ann; and other established mines, besides SHARES in some recent adventures of great promise; TWENTY SHARES in MARKE VALLEY, and FIFTY £20 SHARES in the AYLESBURY RAILWAY, of which particulars are preparing, and may be had in due time at the Auction Mart; at the Golden Lion, Liverpool; Pearce's Hotels, Truro and Penzance; and of Mr. C. Warton, auctioneer, &c., 20, Throgmorton street. 1

STEAM-ENGINE AND MINING MATERIALS.

MR. WILLIAM MURRAY, Jun., has received instructions to SELL, BY PUBLIC AUCTION, at Liskeard Consolidated Mines, in the parish of St. Cleer, Cornwall, on Wednesday, the 27th day of November inst., at Eleven o'clock in the forenoon, the following valuable MINING MATERIALS—viz.:

A 30-inch cylinder STEAM-ENGINE, with 9 feet stroke in cylinder and 9 feet in shaft, equal beam—complete, with a better about 7 tons.

| | |
|---|---|
| Capstan and shears. | Horse whim. |
| Capstan rope, 12-inch. | Whim rope. |

Large balance bob—complete.
50 fathoms 16-inch pumps, with 10-inch plunger—complete.
13 fathoms 11-inch bob—complete; 17 fms. 9-inch bob, do.; 17 fms. 7-inch bob, do.
40 fathoms 8-inch connection-rods, with strapping plates—complete.
60 fathoms of ladders. 70 fathoms of air pipes.
Smiths' bellows and anvil; smiths' tools; a quantity of new and old iron.
A quantity of new and old timber, and a variety of other useful articles.

The engine and materials are nearly new, and are worthy the attention of mine agents generally.

For particulars apply to the agents on the mine, or to the porter, Mr. Jas. Jaggar, jun., Liskeard.—Dated Nov. 12. 2

DEE BANK FORGE.—Freehold and Leasehold Land and Premises, two valuable 24 horse power Engines and Machinery, Rag &c.

MESSRS. THOMAS WINSTANLEY and SONS, of Liverpool, have received instructions to SELL, by AUCTION, on Wednesday, the 4th December next, at One o'clock, at the Clarendon Rooms, South John-street, Liverpool (unless previously disposed of by Private Contract), the highly desirable and valuable freehold and leasehold land and premises known as the DEE BANK FORGE, BAGILT, slightly situate on the Holyhead and Chester highroad, bounded on the north by the river Dee, and on the south by the Chester and Holyhead road. The buildings are recently erected, and of the best stone, and covered with fine slate, the roofing is finished, and the woodwork of the best materials, and consist of a fitting shop, 140 feet by 24 feet, and a boiler shop, 61 feet by 24 feet, and contain a slide lathe and a variety of other lathes, large boring mill, drilling and screwing machines, powerful punching press, bending rollers and tools, worked by an excellent 24 horse power condensing engine.

The smiths' shops, 180 feet by 24 feet, are fitted up with steams, complete sets of working tools, &c. The hammer shed, 70 feet by 37 feet, erected on iron pillars, contains a hammer of 7 tons, and ditto of 4 tons, cutting shears, with preparation for having a 15 hammer, 15 ton crane, 7 ton ditto, worked by a 24-horse power condensing engine. The foundry, 60 feet by 30 feet, is complete with cylinder pit, cranes, drying stoves, moulds, sand beaks, loam plates, cross bars, &c. The pattern shop, 60 feet long, two stories high, containing sets of valuable patterns for engines of several sizes. Brass foundry, 15 feet square, offices, weighing machines, and machinery for lifting burdens of any weight. The engineering yard is 300 feet long and 170 feet wide, at the ends of which are erected the above buildings, together with 4 two cottages, with six rooms each. The premises contain 41 acres, extending to deep water, and are admirably adapted for wood and iron shipbuilders, having the greatest facilities for marine or locomotive work, and the Chester and Holyhead Railway will pass through the land. The leasehold is for an unexpired term of ninety-five years, subject to a rental of £70 per annum.

Further particulars may be had on application to Captain Absolom Francis, on the premises, Bagilt; John Gladdish, Esq., solicitor, Holywell; or to Messrs. Thomas Winstanley and Sons, Church-street, Liverpool. 3

VALUABLE MINING PROPERTY.—The PROPRIETORS of a MINE, now in successful operation, most rich and abundant in its mineralic productions, and upon which they are erecting a powerful steam-engine and machinery of every requisite description, with a view to its extensive working, DESIRE TO MAKE A SMALL ADDITION TO THEIR CAPITAL, which is extremely adequate to the promotion of their undertaking on the proposed scale; they are prepared to treat on terms of a liberal nature, and upon a principle excluding the responsibility which usually attaches to proprietorship in such undertakings.

Messrs. Pritchard and Collette, solicitors, 17, Lincoln's Inn fields, will communicate, to parties disposed to treat, every necessary information. 4

LEAD MINES—ON SALE, ONE QUARTER OF LEAD WORK, which is in Denbighshire, near Minerva, where they are now getting.—Apply to Mr. Edward Jones, North and South Wales Tavern, 71, Chapel-street, Liverpool. 5

IRON TRADE.—WANTED, a PARTNER in the IRON and FOUNDRY TRADES.—For particulars apply by letter (pre-paid), 7th, Midland Counties Herald Office, Birmingham. 6

FOR SALE, A HIGH-PRESSURE STEAM CYLINDER, 8-feet diameter and 10-foot stroke, metallic packed piston, piston rod, crosshead, and cylinder cover; the cylinder is fitted up with two short slide valves and packing for working the same, also an expansive valve and gearing—all in good working order; has only been at work four years, and was recently replaced by a larger one, will be SOLD VERY CHEAP.—Apply to Messrs. James Gray and Co., engineers, Washington street, Glasgow. 7

PATENT METALLIC SAND CEMENT, OR ENGLISH PUZZOLANO.—TO ENGINEERS, ARCHITECTS, AND BUILDERS.—The proprietors of the PATENT METALLIC SAND CEMENT, after ten years' experience of its merits, confidently recommend it to the attention of engineers and architects as a valuable material in all works where hydraulic cements are necessary, and great strength is required. From the chemical properties of the Metallic Sand, it forms, when mixed with lime (no lime, a metallic cement of great strength and density; the iron, which is one of its principal constituents, combining with the lime in which it is deposited, and consequently in a greater degree of hardness than can be obtained by admixture with any other known material. Concrete and mortar, in which the Metallic Sand has been used, are more durable than any other, resisting to indurate with time and not being affected by damp, otherwise than increasing in hardness from the combination which is thereby occasioned. Employed as a cement for pure water from brickwork to tanners, sewers, and other underground works, the Metallic Sand is of the cheapest; and, from its cement adhesive quality, to form a more solid and hydraulic body, in combination with the brickwork, than any other cement at present known; and he will cause the Metallic Sand to found the best substitute for puzzolano that has ever been presented to the public. As an external stucco, the Metallic Cement combines a rich stone colour without the use of paint or that of any kind, does not vegetate, and is entirely free from cracks and blisters, and continues to improve both in appearance and durability by exposure to the weather. The proprietors refer with confidence to works in which the Metallic Sand has been extensively employed as concrete and mortar—viz., at the new Houses of Parliament, the foundations of which were entirely formed of the Metallic Concrete; the principal basins on the Birmingham line of railway, and other important buildings, which are upon particularly reference to the proprietors, where also will be found extensive stucco work, which has been executed with the Metallic Cement; and adding the more recent one to numerous new Gresham Club house in King William-street.

Further information will be given, and specimens shown, on application at No. 6, C. E. Street, 4, New Broad-street, and at the Metallic Cement Wharf, King's road, opposite Pitt-street, Caledon New Town.

LAWRY ON DEBILITY, NERVOUSNESS AND ALL DISORDERS ARISING FROM EXCESS, &c.

"He who to pleasure's downy wave
Is lulled into health, or youthful charms,
Rarely will he heed, or profitable lessons,
Rarely will he heed, or profitable lessons,
Rarely will he heed, or profitable lessons

## SUPPLY OF PURE WATER TO THE METROPOLIS AND ITS SUBURBS—PROPOSED NEW COMPANY—No. IV.

Taking into consideration the various circumstances to which we have adverted, together with the detail of evidence taken at various periods before the several committees of both Houses of Parliament, by which they are proved and illustrated, and also the facts that have been brought before us by medical witnesses in support of their strongly-urged and unanimous opinion, that no population can be healthy which live upon, and derive their supply of air and drinkable article of consumption from a source impregnated with the refuse of animals, and decomposed animal and vegetable matter, that the deficiency and impurities of the supplies of water in districts inhabited by a thickly-peopled population must generate nuisances, a low state of health, and extensive disease amongst the lower classes—we may state that experience would prove the advantages in household and personal cleanliness in health, if the existing monopoly to which these defects are attributed were superseded by improvements effected for the extension of the supplies of a cheap, pure, and salubrious water, into the houses of a class who are debarred from participation in the advantages of an element of Nature, by the restrictive and simultaneous confederacy of a compact entered into by those local companies on the south side of the metropolis. We may affirm, from evidence derived from our own observation and experience, that a stream of water which receives daily the abductions and evacuations of two millions of human beings, of many thousand animals, with all the filth and refuse of the various offensive manufactures, which, of necessity, must be carried on in one of the most populated cities of Europe, cannot be purified to be analysed, whether it ought to be pumped up as a beverage for the inhabitants of the metropolis of the British empire. The question is not whether a few grains of this innocuous filth can, by chemical process, be extracted from a given quantity of water, but whether, without any process at all, this stream, palpably known to contain all this mass of filth, should continue to be supplied to the inhabitants of London. Self-evident, however, as this truism appears to be, it is nevertheless the fact, that the water of the Thames was analysed by persons whose practical skill, united to scientific acquirements, enabled them to ascertain its real qualities by actual experiment. The water they obtained from the Thames was taken not only from different parts of the river, but at various depths and state of the tides, as well as in different temperatures. Hence it must be evident, that every precaution tending to ensure accuracy, and to prevent mistake, was carefully adopted, so that nothing might be left to supposition and conjecture. An analysis of the water had been made by several individuals of high authority on these matters, including Dr. William Lambe, Dr. Pearson, and Mr. Richard Phillips; still it was considered necessary, in order to insure accurate information, and to draw satisfactory conclusions, to subject the waters to the analysation of Dr. Bostock—a gentleman eminently qualified for the task, by his extensive knowledge of chemistry, and his practical experience in this department of analysis, and was selected on the part of the Crown to analyse the specimens of water taken from different sources during the late Mr. Telford's inquiry, to ascertain how far the water of the Thames, contiguous to, or in the neighbourhood of, London, was in a state proper for being employed in diet and various other domestic purposes. The effect of the chemical analysis was, the discovery of extraneous matter of a putrescent nature, and other substances in great abundance, most deleterious to health, and unfit for domestic purposes, the result of which experiments were given in evidence before the committee of the House of Commons, 1834. The general conclusions he adduces from the whole series of analyses are expressed in the following passages, condensed from his report to the Commissioners on supply of water to the metropolis, 1828:—"By a simple inspection of the specimens, I think myself warranted in asserting, without any reference to experiment, that in all the waters the extraneous matter was so considerable, as to render them improper to be employed for diet; it contained a considerable number of floating masses, flocs, films, &c.; it was slightly opaque, and of a brown tinge, distinct smell of tar, unmeat taste, and the odour, which may be characterised as like that which exists in water which has had decayed wood macerated in it. The real quantity of ponderable matter that was suspended in the water was found very difficult to obtain in a separate state by means of the filter. I adopted the method of subsidence, and obtained a quantity which contained nearly all the extraneous matter. During the evaporation, a copious odour was emitted from the fluid, which may be described as resembling the smell which proceeds from foul drains; when the evaporation was completed, a dark grey homogeneous mass was obtained, which exactly resembled dried street mud." The impurity and insalubrity of the water, as supplied by the confederated companies, it is submitted, is placed beyond the possibility of a doubt—for, on the south side of the river, Dr. Bostock reports that samples taken in the neighbourhood of the works of the Southwark, Lambeth, and Vauxhall Companies, exhibits water loaded with extraneous matter, unpleasant odour, decidedly nauty taste, and the flavour of stagnant water. And says—"I completed my experiments by specimens taken at low water, about 100 yards below Southwark bridge, in the middle of the river, and at the Dolphin of the Lambeth Works, above Waterloo bridge. The specimens were all opaque and discoloured; they contained a considerable quantity of black sediment, filmy and floccular matter, and exhaling a highly fetid odour." The experiments also of Dr. William Lambe and Dr. Thomson are clear that the Thames water holds animal and vegetable matter in solution, which would not be got rid of by filtration, but would accumulate in the vessel from which the water evaporates, and thus an injurious impregnation would be given to soups, tea, coffee, and all other liquids dress to the fire, which has not undergone distillation, and this admitted would be increased if the water added to the boiler be not previously filtered, for then all the suspended impurities would be in addition to those held in solution, and by repeated introduction into the stomach, the injurious impregnation would undermine the health. It is self-evident, therefore, that a constant and efficient supply of pure and wholesome water is essential to health and comfort, and it is manifest that the general quality of the water is foul and objectionable within the whole range of the London district whence the supplies for the metropolis are drawn; any reasoning has hitherto been comparatively unimportant when water, containing so large a proportion of foreign matters as is poured foul into into the Thames, and for the impure as to feeling foul, cannot even, when clarified by filtration, be pronounced free from the imputation of general insalubrity, and there is no grounds for assuming the probability of any metropolitan improvement to the present state of the supply of water to the metropolis. The years of 1826, 1828, and 1829, was so much remarkable as being attended the birth of an attempt to remove the filthy and avowed fluid to a tolerable condition; time answered its purpose, only the experience to confirm and establish the complete failure. It is now substantiated by one of others and talented practical engineers, that the method of filtration cannot succeed to the foul, that the process for filtering Thames water free from extraneous matter is inefficiently secured by outsiders or shareholders. The impression of the system of filtration is formed upon the basis of well-tested experiments of such eminent in hydraulics, whom from have been almost invited to the subject, who maintains that it is a fallacious idea, inasmuch that the principle of the filter is impossible; and so far as our observations have gone, we are prepared to say that the consumers of wholesome matter under very degrees of doubt, and across the supply of water is practically taken from a pure stream, contrasted with the refuse of innumerous mills and factories, and the impregnation of animal and vegetable matter, the filtering medium becomes clogged, and counteracted by the process of the deposit of filth, in less than twelve days, to such an extent as to create great difficulty in cleaning it after that deposit has been formed, and the months they adapt to be after the last to be made dirty, and were cast to with common opinion, and except all the contrary. The process of filtration is not sufficient to remove the extraneous matter from the Thames water—however artificially cleansed, it will not continue perfect water to a state of purity for the use, even after it has passed the filtration; the Thames water has a taste, according to the season, of animal or vegetable matter, and is although to degree is of that unpleasant flavour is a fishery. We think it may render the water tolerably free from mechanical matter that are suspended in it, but it cannot be sufficient remedy to remove the animal or vegetable impurities held in solution. The method of filtration, it is well known, can only produce transparency, by arresting such particles of matter as are in a state of mechanical mixture with the fluid, but such matter that is held in chemical solution in the fluid will pass with it through the pores of the most delicate filter. Every one must be convinced from the mixing of filtered Thames water of its impurity, that it will not keep for any length of time with as the satisfactory very nature of the water is impure, and, while clear to the eye, is in some degree deleterious to health.

The attention of the directors of the Water Works companies has, and there, been for years so extensively directed to the improvement of the quality of their supply, by supporting and carrying into effect various plans the attempting pure and free impurities which their consumers, and have expended considerable sums of money in improving their supply." Now, to the word "improvement," they do not write that they have gone in quest of a pure stream, but that they have derived means of transmitting the impure, filthy as at the source, which by a cast of chemical fashion, and after having thoroughly given it to the satisfaction of pure water, to send it into the houses of their consumers, to be used as such, for all culinary and domestic purposes. That the large population of 220,000 inhabitants located in the southern districts of the metropolis, should in this way be supplied with a necessary element of life, and then be told, that "they were never better supplied, both as regards quantity and quality, than they are at the present moment; and that such water has never yet been equalled, or even approached, in extent or modern times," is, we submit, a gross fallacy. To every person who has witnessed the slow progress of filtration, the notion of cleansing daily more than 5,000,000 gallons of water, which has been declared by eminent professional men to be a filthy fluid, "loaded with decayed animal and vegetable matter and other substances equally deleterious to health, and unfit for domestic purposes," carries its own absurdity along with it. It is physically impossible for the existing companies to obtain a square of reservoirs sufficient even to allow this impurity to subside from settlement alone, much less to filtrate nearly 6,000,000 gallons every day; and will the British Parliament, with the example of Paris, London, Edinburgh, and other large cities before their eyes, longer submit to hear of the gross fallacy of analysing the diluted excretions of 2,000,000 of human beings, and the refuse of our manufactories, in order to judge of the expediency of continuing it our daily beverage. Water impregnated with animalcule, and other substances equally deleterious to health or comfort, or exceeding the mutual compact agreed upon by the several water companies on the south side of the Thames, who have partitioned the districts between them, and established a close monopoly of an element of nature, thereby limiting the privileges of a large class of consumers in a densely peopled district, from the right of taking their supply from a source by which they could obtain water, in a pure and salubrious state, at the moderate rate of £1. per hogshead, of sixty three gallons. I admit the justice, that the three local companies have been at great expense in making reservoirs, but which in no way can tend in the slightest degree to the filtration of the Thames water, as is alleged by them; they may assist in permitting the dense impurities of the water to subside, but can in no way extract those poisonous qualities which the Thames water holds in solution.

## RAILWAY ENGINEERING—TUNNELLING.*

After the great experience acquired in tunnelling within the last twenty years, through every description of strata, a practically descriptive work like that of Mr. F. W. Simms must be highly acceptable to the profession, particularly to its junior members, and to contractors, who have not had much experience in the construction of such works. The author has, as much as possible, avoided all theoretical speculation on the subject, and the work is devoted to the practical details of the works of the Birkbeck, Hay and Saltwood Tunnels, which were constructed under his charge—the amount of labour consumed, and the prices paid for it, as well as every description of material; and, although these must differ in almost every locality, and that of labour particularly through localities in which the primitive rocks abound, the actual cost in the cases under consideration must prove most useful information.

As further remarks must be unnecessary to prove the value of the work, we shall proceed at once to give a short abstract of its general features.

Beginning with the geological features of the South-Eastern Railway, the author traces its construction, commencing at the metropolis, through the London clay to New cross, where the plastic clay appears at the bottom of the slopes of an open cutting; this plastic clay formation at this locality is interesting, as in a thickness of only 9 ft. 4 in. there are no less than thirteen lines of strata, consisting of varieties of clays and sands, and one of lignite half an inch in thickness. The line then continues upon the plastic clay formation to Combe-lane, Croydon, where the chalk crops out; it then crosses the great chalk range towards its escarpment at Merstham, the tunnel near which plays in its greatest excavation level; here the green sand formation appears, and near the village the gault is seen further south; the lower green sand rises to the surface in beds of brown coloured sand, very siliceous and good for engineering purposes. The middle beds next appear, and these are followed by the lowest beds, in which are the Kentish rag-stone, fuller's earth, &c., the famous Nutfield Pits being situated in this locality; these lower beds rise to a considerable height, and form the range of sand hills which pass through the country parallel to the great chalk range. The place where the line crosses the sand range is called Redstone Hill, and here the Brighton line continues southward, while the Dover passes round the hill with a curve of half a mile radius to the eastward, and at a place called Robert's Hole Farm the weald clay next appears from beneath the sand; it then passes in successive outcrops and embankments through the weald clay for many miles, and the Bletchingley Tunnel at Tilburstow Hill, to Ashford, where it again enters the green sand formation, in which it continues for fifteen miles to Folkestone, where it enters the chalk by a tunnel through the hill to the Warren, and from thence to Dover through and along the face of the cliffs, altogether one of the greatest works in the kingdom, and where Mr. Cubitt so successfully introduced gunpowder in removing large masses of chalk, particularly at the Round Down.

The author then proceeds to notice the formation of the Bletchingley Tunnel. The blue clay of the weald was at first greasy to the touch, and when dry was a hard shale, requiring much gunpowder in the excavation, but upon exposure to atmospheric action became considerably softened; by this reason the work was obliged to be closed, pulled quite down to the lower sill; the pressure often threatened to bent in the lagging after complete forcing, and required constant watchmen; about one foot, frames of fifteen inches thick, were often crushed and broken, as if they had been mere sticks. The monthly progress of the actual tunnelling after the sinking of the shafts was as follows—May 104 yards, June 102 yards, July 104 yards, and August 100 yards; the bricks were made on the ground and attended to the pit's mouth, where the cost, including waste, was £1. 1s. 6d. per 1000; the whole cost of the work was £1,[illegible] 17s., or £11. 10s. 7d. per lineal yard, it being 1324 yards long, or three quarters of a mile and four yards.

Saltwood Tunnel is also situated in the parish from which it takes its name, and is 1184 yards in length, and declines towards Dover at the rate of twenty feet per mile, or 1 in 264; it is constructed at the top of the middle beds of the lower green sand, at about eighty feet from the surface of the ground. The difficulties in sinking the shafts, which were also first in the water, from the great quantities of water, were very great; the ground being a perfect quicksand, the miners were obliged to be relieved in four shifts, and the horses were so bewildered up from the incessant labour, and several having died, great difficulty was found in keeping a supply. At length, the board of directors contracted with Messrs. Grissell and Peto to complete the tunnel for £[illegible], exclusive of the extensions, they allowing the company actual for the plant and materials; the preliminary works, which had cost the company so much, of course were highly advantageous to the contractors, and greatly facilitated the work; the entire cost was £11,[illegible] 1s. 8d., or £[illegible] per lineal yard. The bricks were made at Folkestone, five miles distant, and cost £[illegible] per 1000.

The work then proceeds to describe the observatory and transit instrument, with directions for its use, the setting out the shafts, carrying the head lines, with the various modes of sinking and working the shafts, which of course we cannot follow. Some experiments on horse power are interesting—for instance, at the Saltwood Tunnel, the following is the average results:—Horses working three hours, at [illegible]; three hour hours, 18,[illegible] lbs.; three hour and a half hours, 18,[illegible] lbs.; three six hours, 10,[illegible] lbs.; three eight hours, 10,[illegible]. There were about 100 employed of good quality averaging 15 hands 2 inch, weight 1[illegible] cwts., costing from £[illegible] to £[illegible] each, and had on work more as they could get; job with the above high results, they went under the common hedges, and starve of their stock.

The concluding chapters of the work describe the methods of securing the tunnels while driving, the cubicles, &c., with valuable tabular matter, showing the cost of each section, amount of labour by men and horses, and concludes with Sir John Rennie's Report on Highgate Archway in 1811, which, though short, is an interesting document, as showing the great advance which has taken place in the science of tunnelling within the past thirty years. The work contains forty six wood cuts, and twelve beautifully executed plates, the paper and type being very superior; and the author has omitted nothing which could render the work of the utmost advantage to those for whom we it is intended.

* Practical Treatise, containing in detail the setting-out of tunnels, shafts, sinking, &c., by F. W. Simms, Esq., C.E. F.G.S., F.R.S., and M.R.I.A. London: Longmans and Simms, and Weightman, Edinburgh, and Cox.

## ACCIDENTS IN MINES AND COLLIERIES.

From Jan. 1 to June 30, 1844—as reported in the *Mining Journal*.

| 1844. | Name of Mine. | Nature of Accident. | Fatal. | Injured. |
|---|---|---|---|---|
| Jan. 6 | Bloor's Colliery | Do. do. | 12 | 9 |
| | Chester Moor | Explosion of gas | 3 | 3 |
| | Wardley-lane End | Do. do. | 5 | 15 |
| | George Pit | Fall of a rope while ascending pit | 1 | - |
| | Shotton Colliery | Crushed by a tub | 1 | - |
| | Dowlais | Fall of a stone | 1 | - |
| | Cyfarthfa Mine | Do. do. | 1 | - |
| 13 | Pontypool Colliery | Explosion of gas | - | 3 |
| | Lincolly | Cause not assigned | 1 | - |
| | Alexander Pit | Fall of coal | 1 | - |
| | St. David's Colliery | Do. | 1 | - |
| | Hanley Woodhouse | Drowned in pit | 1 | - |
| | Pontefract Pit | Breakage of rope | 1 | - |
| | Flowery Field Colliery | Explosion of gas | - | 4 |
| 19 | Crump Meadow Colliery | Fall of a stone | 1 | - |
| | Shotton Moor Colliery | Accident | 1 | - |
| | Wh. Providence Mine | Do. by handle of windlass | 1 | - |
| | Kingswinford | Fall of coal | 1 | - |
| | Crest Pit, Whitehaven | Fall in shaft | 1 | - |
| | Duke Pit, do. | Explosion of fire damp | 11 | - |
| 27 | Pensilwold | Fall in pit | - | - |
| | Cwmy | Do. | 1 | - |
| | Longfield | Fall of a stone | 1 | - |
| | Delabole Slate Quarry | Fall of rock | 2 | - |
| | Penzepdarren | Fall of stone | 2 | - |
| | Abersaire | Fall in pit | 1 | - |
| | Dudlyn Colliery | Do. | 1 | - |
| | Kilnsworth Colliery | Explosion of fire damp | - | 6 |
| | Monmt Mine, Mt. Stuary | Fall in pit | 1 | - |
| Feb. 1 | St. Helens | Fall of coal | 1 | - |
| | St. Helens, Auckland | Do. | 1 | - |
| | Cleland, near Holytown | Fall in shaft | 1 | - |
| | Shotland Pit | Do. | 1 | - |
| | Levant Mine | Do. | - | 1 |
| | Dalzel | Fall of coal and fall in shaft | - | 2 |
| 10 | Maesteg Colliery | Fall of a stone | 1 | - |
| | Hetton le Hole | Do. | 1 | - |
| | Tavistock | Accident by engine | 1 | - |
| | Methyr-bridge | Fall in shaft | - | 1 |
| | Preston's Colliery | Accident | 1 | - |
| 17 | Dowlais | Fall of coal and rubbish | 1 | - |
| | Botallack Mine | Fall of a stone | - | 1 |
| | Pendewick | Fall of mash | 3 | - |
| | Coalsa | Accident | 1 | - |
| | Cwmbysoll Colliery | Fall in pit by chain breaking | 1 | - |
| | Kilnsmarsh Colliery | Accident | 1 | - |
| | Stonebrough Colliery | Fall of rubbish | - | 1 |
| 24 | Landshipping Colliery | Breaking in of a stone | 45 | - |
| | Billings, St. Helens | Fall in shaft | 1 | - |
| | St. Hilda Pit | Accident | 1 | - |
| | West Cornforth Colliery | Drowned | 1 | - |
| | Hawaia Iron-works | Accident | 1 | - |
| | Caldewn | Fall of a stone | 1 | - |
| | Cyfarthfa Iron-works | Accident | 1 | - |
| | Rowley Regis | Explosion of foul air | 1 | - |
| | Dudley Port | Explosion of gunpowder | 1 | - |
| | Poulton Mine | Accident by whim | 1 | - |
| March 2 | Holmbrook Mine | Fall of rubbish | 1 | 1 |
| | Wingate Grange Coll. | Fall in staple | 1 | - |
| | Hawkins Mine, Hollywell | Fall in shaft | 1 | - |
| | Beaney Colliery | Accident | 4 | - |
| | Dalcoharl Colliery | Fall of roof | 1 | - |
| 9 | Poynton and Worth Col. | Fall in pit | 3 | - |
| | Plymouth Iron-works | Accident by rails | 1 | - |
| | Penydarren | Fall of coal | 1 | - |
| | Wigan | Accident | 1 | - |
| | Crich, Derbyshire | Accident from blasting | 1 | 2 |
| | Grove Colliery | Explosion of fire damp | 1 | 2 |
| 16 | United Hills Mine | Accident from blasting | 1 | 1 |
| | Tresavean Mine | Fall of roof | 1 | - |
| | Middleton in Teesdale | Drowned | 1 | - |
| | Penydarren Iron-works | Fall of a stone and rubbish | 1 | - |
| 23 | Cronkington Colliery | By being drawn over the pulley | 1 | - |
| | Hardcastle Mine | Accident from blasting | - | 2 |
| | Magpie Mine | Fall in mine | 1 | - |
| | Great Newton | Accident | 1 | - |
| 30 | Clondalkin | Fall of roof | - | 2 |
| | Cyfarthfa Iron-works | Fall of earth | 1 | - |

* Personal injuries.

[To be continued in our next.]

[illegible].—There is now in the embrasure of useful knowledge in the future of the Great Polytechnic Institution, a model of a coring tube invented by Mr. Joseph Green, of the Minories, which ought to be more generally known, because it is a very important invention, and now that it [illegible] [illegible] thousands of pounds; we are affording to that [illegible] [illegible] which we also have been not so sure to get [illegible] [illegible] which are not also effective as generally what has been done [illegible] [illegible] Mr. Green's own personal experience [illegible] experimenting the 30 effects of that [illegible] [illegible] [illegible]

## THE CORNWALL COMPETING LINES.

[FROM A CORRESPONDENT.]

Last week we referred to two lines through Cornwall, but in this age of brilliant enterprise we must not be surprised at any effort, however extraordinary. Another line, making the third, is presented—or, we presume, from the notice in the *Gazette*, is to be presented, to the public, of "a Central line through the north of Devon and Cornwall," in conjunction, too, with the Great Western!—not that the Great Western has presumed to have anything to do with it, but it will most fraternally embrace the Great Western. We understand, however (which we were not before aware of), that the mines in Cornwall are so rich, that it will require, in future, three railways to take the adventurers to and fro, and bring up the superabundant capital realised by them in their profitable speculations. Nothing else, certainly, can justify these schemes, for such a country and such a population as is to be found in North Devon and Central Cornwall. The public have been entertained, too, with some amusing correspondence on the subject; somebody said, and all Cornwall believed, that the banking firm just reared upon the ruins of the Western District Banking Company, consisting of Messrs. Ricketts, Turner, and Co., was to advance 500,000*l.* towards the Central line. Mr. Ricketts says this has no foundation, and he never knew anything about it; the partners may play pitch and toss with their sovereigns, of course no one can prevent them, but Mr. Ricketts will not be one of the party—so there, after all these fine expectations, the matter ends in smoke.

Next, the South-Western Company sail, or allowed Mr. Snow to say, great things at the public meetings in Cornwall, and evidently it is everywhere whispered that the tyrannical conduct of the Great Western must not be tolerated in Cornwall, and the only liberal men deserving encouragement are the directors of the South-Western Railway—the centralists, contemning the offer of 250,000*l.* subscribed by those companies who are interested in taking a line through Cornwall, and form a coalition with a company whose chief prosperity is derived from Falmouth's rival port, Southampton. Well, some thought the South-Western were at last going about their work with some energy, and we should see the tables turned upon the Great Western—that they would drive the Great Western, Bristol and Exeter, and South Devon out of the field, and into the sea, and carry the west country before them.

Lines innumerable in that direction were planned, and what is the upshot? that by this notice they mean, on the 7th of next month, to meet and talk about certain extensions contemplated next year, but not a sentence is breathed of any line west of Yeovil, whilst having fanned the county of Cornwall into a flame of discord, they abandon the centralists to their bitter fate, and hope they have accomplished their object, for this year at least, if not altogether, that of preventing a railway through the county of Cornwall at all.

With these two facts—undeniable facts—will any more money be raised for Cornish lines? will there be found persons foolish enough to contribute to the amusing employment afforded to lawyers, engineers, and allotment letter traffickers? We should hope not—let them wait a little; one line has already hooked up the capital—see how that line gets on, ascertain what the Board of Trade means to do. Money spent in a Parliamentary contest cannot be got back again, and if any one will take advice, it is freely offered, "keep your pockets buttoned."

[Although the Editorial we is adopted, it must be understood that the remarks are those of "a correspondent" from manuscript, and therefore we must not be held responsible for the opinions of others. We deem it necessary to say thus much, as a correspondent in our present Number, "One of Them," would imply that the remarks of last week were Editorial.]

## THE CORNWALL RAILWAYS.

TO THE EDITOR OF THE MINING JOURNAL.

Sir,—I perceive in your *Journal* of last week a letter from Mr. Robert Walker Childs, one of the candidates for the secretaryship of the Plymouth and Falmouth Railway, to which he states—"It is simply untrue that I ever canvassed the county for shares at 2*s.* 6*d.* each, as asserted by Mr. Tilly." I have not the pleasure of knowing Mr. R. W. Childs, and I have never used his name in any other way than by reading at different public meetings his appointment to canvass the county, the original of which, under the hand of "P. P. Smith, Secretary *pro tem.*," a friend of mine will show you, and which will prevent any further quibbling on the subject." The following is a copy:—"Resolved, that Messrs. Carthew, Childs, and Hunt, be authorised immediately to commence a canvass of the county for subscriptions, dividing the county into three districts. The remuneration to be 2*s.* 6*d.* on each share of 50*l.*, which may be allotted to the party taking the same, and upon which the deposit shall be paid."

Mr. Childs will not now repeat, that he did not canvass the county for shares, and that, too, under the above appointment. This very "simple denial" will, I think, hardly help him to the secretaryship. But not even the gallant handiwork of Mr. Childs can save the Cornwall, Plymouth, and Falmouth Railway from its inevitable fate—inglorious and deserved defeat. Unanimously scouted by the county at public meetings held in almost every principal town, Falmouth, Penryn, Redruth, St. Columb, Wadebridge, Padstow, Bodmin, Helston, Truro, and Penzance, and by the county of Devon at the Guildhall, at Exeter, where none of its "disinterested" supporters, its "leading men," dared to show their faces, or question a statement made. It has been driven to its last shift, and certain officers of that dismal project (friends it has none) have goaded themselves of the press, to obtain the advantage of a week's misrepresentation, although they must have felt certain that the next would bring exposure and retaliation.

"The twenty-four tunnels"—"the fertilising committee"—the "almost conviction" of one, that "the Central Line would barely pay the working expenses," a statement so monstrous, and so directly in the teeth of his previous advocacy of a Central Line, as to lead his personal friends, for the protection of his character, to declare their belief that the letter in the *Times*, with his signature, was a forgery—the equally honest, but ridiculing, conviction of his colleague, that this line would only pay 4*l.* per cent.—the "artful dodge" got up last week, of forbidding Mr. Frederick Ricketts to deny that he had authorised a statement which had come here much hot by themselves, and that for an obvious purpose;—these and other misrepresentations have so disgusted some honourable members of state that declining provisional committee, as to induce them to withdraw, and to "sicken" others, who, merely on "a point of honour," yet permit the use and influence of their names.

The communication "From a Correspondent" in your *Journal*, soon, contains not a few specimens of the present malicious, but very feeble, mode of attack, and sufficiently shows the weakness of the cause which requires such desperate, but despicable, efforts to maintain a struggling existence—*Quem Deus vult perdere prius dementat.* I am, Sir, your obedient servant,

Penzance, Nov. 19. T. HARRY TILLY.

## CORNWALL AND DEVON CENTRAL RAILWAY, AND BRISTOL AND EXETER RAILWAY COMPANY.

TO THE EDITOR OF THE MINING JOURNAL.

Sir,—An advertisement appeared in the *Times* of this last, headed "Bristol and Exeter Railway Company," which is authenticated by the signature of the secretary (Mr. Badham), and is to the following words:—

"In consequence of statements which have been made at public meetings in the county of Cornwall, and elsewhere, and in some of the newspapers, that the chairman of the Bristol Railway Company (Frederick Ricketts, Esq.) has given his personal support to the Central Cornwall Railway, in opposition to the Cornwall Railway from Plymouth to Falmouth (which since time has the undivided support of the Bristol and Exeter, the Great Western, the Bristol and Gloucester, and the South Devon Companies, of all which he is a director), and that the banking firm in Cornwall of which Mr. Ricketts is the head has engaged to make a large advance of money to the Central Line, I am directed to publish the two following letters, by which it will be seen that those statements were altogether unauthorised by Mr. Ricketts, and that he continues to be chairman of the Bristol and Exeter Company.

By order of the directors, J. P. BADHAM, Secretary.

Bristol Office, 30, Broad street, Nov. 13."

Having been present at, and taken part in, most of the public meetings held in Cornwall on the question of the Central Railway, and having attended as a deputation the meetings held "elsewhere" (viz., at Bideford and Exeter), I can give the most unqualified contradiction to the assertion, that at such meetings it was stated that "Frederick Ricketts, Esq., had given his personal support to the Central Cornwall Railway, in opposition to the Cornwall Railway from Plymouth to Falmouth"—for on every such occasion it was distinctly announced that Mr. Ricketts was in no way connected with the Central Railway, although his partners in the bank in Cornwall, Messrs. Turner, Rashleigh, Martin, and Tyndall, were all satisfied of the practicability of the project. This I have repeatedly affirmed, and the same statement has invariably been made by the other gentlemen with whom I have been associated in this undertaking; so far, therefore, from such representations having been made, as alleged, gentlemen have been taken to participate in an undertaking, to which the support of the parties might otherwise have led. At the great and influential meeting held at Exeter, on the 3d inst., which I had the honour of addressing, there were present the representatives of three of the associated companies—Mr. Saunders, the secretary of the Great Western; Mr. Badham, the secretary of the Bristol and Exeter; and Mr. Gillespie, the secretary of the South Devon Railway—besides directors and shareholders to some of these companies. I can state positively, whatever at that meeting it was asserted that "Mr. Ricketts had given his personal support to the Central Cornwall Railway," or whether that gentleman was by implication excepted from all connection with it? I appeal to the gentlemen, and to every gentleman present at that meeting, for such qualification to the assertions which I give to such a statement. I distinctly remember saying at that meeting—"Gentlemen, if I may state my belief, everyone" (the Mr. Saunders, Mr. Badham, or Mr. Gillespie, mentioned in questions and observations of mine? Had I made such a statement as is insinuated in the advertisement signed by Mr. Badham, could that gentleman have permitted himself to become an aspersing party by remaining silent? The publication of the advertisement in question furnishes evidence of the peculiar means resorted to to serve a temporary purpose, and to assail indirectly the character of a most honourable man, merely because his partners in a banking company venture to act upon their own judgments, and to identify themselves with an undertaking calculated to benefit that county in the prosperity of which they had become deeply interested. With respect to the offer by them of a sum of money towards the construction of the Central Railway, I apprehend Mr. Turner's statement at Truro will be found sufficiently explicit, and that the advertisement can hardly be expected to obliterate a fact.

I would suggest to the Great Western Company the propriety of consulting the county of Cornwall on the subject of a Cornish Railway, instead of deluding themselves into the belief, that, against the expressed determination of that county, united as it is in favour of a Central Line, they can succeed in carrying out the Coast Line, a project calculated to be beneficial only to the private interests of associated companies, and obviously detrimental to the public good. I am, Sir, your obedient servant, THOMAS HARVEY.

Secretary of the Cornwall and Devon Central Railway.

5, John Street, *Adelphi*, Nov. 18.

## THE RIVAL RAILWAYS IN CORNWALL.

TO THE EDITOR OF THE MINING JOURNAL.

Sir,—The remarks in the *Journal* of the 10th instant, in reference to the two proposed lines of railway in Cornwall, and which you give as "From a Correspondent," may more reasonably be taken as coming from the Editor, in consequence of the frequent introduction of the pronoun "we." Be this how it may, they are evidently produced with the intention of injuring the central line, by an attempt to throw ridicule upon the undertaking, and upon those who have come forward in support of it.

Whether the parties who have interested themselves in the central line commenced their proceedings without "any delegated authority"—whether the members of the provisional committee are men "without standing, interest, or influence in the county"—or whether they fancied that "all who had gone before them were incompetent," I will not stop to inquire. Where matters of fact may be produced in order to disprove the propriety of such an undertaking being persevered in, there can be no occasion to make use of misrepresentation for the purpose; nor is it worth while to attempt a contradiction of such vague and undefined insinuations as are contained in the remarks to which I refer. Where, however, a positive assertion is made, a positive contradiction may be given, and which I do give to the statement, that Captain Plumridge has adopted the alternative of resigning his seat in preference to putting his name in the list of the committee; he having consented to become a member of the committee, and in doing so, he expressed his conviction that a central line will be the best for the county.

There is not a part of the kingdom in which the proper and most generally beneficial line for a railway is pointed out so clearly as in Cornwall. It is a long strip of land; and the traffic of the county being insufficient to support two lines, it will naturally be inferred that one line through the centre would best suit the inhabitants of all districts; unless their could be pointed out, beyond a doubt, that the carrying it through a district on one side of the county, to the entire exclusion of its benefits from the inhabitants of the other and more distant parts, would be attended with the greatest advantage to those concerned in its construction. It is a question, also, for the decision of the inhabitants; it has nothing to do with districts beyond the extremity of the county, west, south, or south of it, there being none; it is perfectly insulated, and can only be made useful to the parties residing in the county; at least, it may be viewed in that light in regard to the western extremity of it, and the question of the greatest importance to be decided, is, as to its extension eastward.

It is true that for four years efforts were made by the leading and more influential gentlemen in the county to get a railway made throught it, that a "feasible" plan had been struck out for accomplishing it, and that that plan was the southern line between Falmouth and Plymouth; but it was adopted at the time because the means could not be found for constructing the central line, which was admitted by all parties to be the best adapted to the purpose.

This was adopted as a matter of necessity, and it was facilitated by the adoption of a line to be made between Exeter and Plymouth. Subsequently, things took a turn in favour of the central line, and those who are the most interested in having a railway carried through the county—that is, the inhabitants—have come forward almost unanimously in favour and support of the central line, because it suits their purpose best, and they certainly are the best judges of what they require. One of the leading features which stimulated the inhabitants to push the formation of the railway, was a hope and an expectation that the packet station may be re-established at Falmouth (the object of the South-Western Railway Company in joining this central line being, you say, to prevent the removal of the packets from Southampton); and if anything would lead to the fulfilment of this expectation, it could only be effected by using the most expeditious means of transporting the mails from Falmouth to London. The adoption of the central line will be a saving of fifty miles in the distance, when compared with the south line. Here, then, is one very important object in favour of the central line. Much stress has been laid upon the assertion that the south line will connect Falmouth and the western part of the county with Plymouth, more readily than the central line will do. If Plymouth were the chief object of the introduction of the railway, there might be some excuse for bringing forward this argument, although even then it would not be founded upon fact; but this is a part of the question of a very minor importance, when compared with the other considerations upon which the question rests. The great benefit derived from the establishment of railways is to bring the most distant parts as near to each other, as to time, as possible; the gain to short distances is a mere bagatelle, although it will be advisable to keep up a communication between the intermediate places also, as affording to all parties the means of reaching the most distant ones. You say that Cornwall is generally supplied from the large manufactories at Plymouth. Will you inform us of what they consist? I know of but one of any importance, which is a soap factory. Perhaps your correspondent is anticipating the establishment of baths and washing-houses for the poor in the county, and that the demand for soap will increase. But, for the sake of argument, we will suppose that there is a great amount of business carried on between Plymouth and Cornwall; would the establishment of the south line afford any kind of facility in conducting it? There will be a line carried from Plymouth to Launceston through Tavistock to meet the central line. The distance from Falmouth to Plymouth, by way of Launceston, will be, by the central line, seventy seven miles; from Falmouth to Plymouth, by the south line, sixty eight miles, and allow half an hour for crossing the Hamoaze, which will be equal to the time to travelling twelve miles. It will be found that the central line will allow of a free intercourse between Plymouth and Cornwall in as short a period of time as the southern would be the means of affording, and this, taking for granted that the passage across the Hamoaze would never be liable to impediment; but, when we take into the account the delays that must arise continually in the crossing of that passage, on one day that the central line will be the more safe, more certain, and, at all times, an expeditious a mode of communication between Plymouth and Cornwall. So much for this part of the subject.

The inhabitants of Cornwall, who are the parties most deeply interested in the question, have determined upon applying to Parliament for a central line of rail; and they have so decided, because it will be a shorter line, a less expensive line to make, and, consequently, a less expensive line to travel over. Even the great Mr. Bond—who, by-the-by, is neither a surveyor, engineer, nor mechanic—now admits that he was at one period favourable to a central line—but with certain reservations for the purpose of creeping out of it. He states that the line then proposed was intended to be a track for trade from Exeter to Okehampton, to Lydford, through Launceston, &c., westward, with a line from Lydford, through Tavistock, to Plymouth; that these distinct branches of traffic were calculated upon—first, between Plymouth and Exeter, by way of Tavistock—second, between Plymouth and Launceston—third, between Launceston and Exeter; that the two first have been cut off by the adoption of the south line through Devon, and by the determination to connect Tavistock with Plymouth. Of the third branch, the traffic from Cornwall to Exeter, which was estimated highly, it also goes, the Bristol and Exeter having determined to go to Parliament for a branch to that place. Now, this is begging the question almost entirely; so, with the exception of the South Devon line, all the other destructive arrows are yet imaginary ones, and are brought forward for the mere purpose of trying to defend a bad cause. Mr. Bond ought to know, that the South Devon line will not take off the whole of the traffic from the central line to Devon Exeter and Plymouth, through Tavistock. If he be so convinced with the bearing on his proposition to be, he dares to argue that the central line, through the western part of Devon, will pass through a thirty mile and a populous part of the county, a communication with which will be opened to Plymouth by means of the central line, which will afford the same advantages to both Plymouth and Devonport, they being largely supplied with coals, corn, provisions, &c., from that district. He knows that the South Devon line can never interfere with the traffic, nor can the inhabitants of that district ever be benefitted by travelling to and from Plymouth by the South Devon line.

With respect to the one of the traffic between Plymouth and Cornwall by the adoption of the central line, have does he make that out? That traffic was to be maintained by the central line which he advocated; why he has not? Because it is determined to join Tavistock to Plymouth!! If the communications with the country that he made between Launceston and Tavistock, are we to be told that the inhabitants of Plymouth will not pass over that route way to Cornwall? Are the inhabitants of Plymouth, Devonport, and the neighbourhood, such dolts as to refuse to open a communication between those towns and the northern parts of Devon and Cornwall, merely because they may wish to support the South Devon line between Exeter and Plymouth? It appears to me, that Mr. Bond has taken too much for granted in the view he has chosen to express, and because he has adopted such a view, he appears to think that every other party must do the same. But, again, in reference to the traffic between Plymouth and Cornwall being lost. The central line, advocated by Mr. Bond, was intended to communicate with Plymouth by a branch from Lydford. The communication with the central line at present proposed, is by a branch from Launceston, both intended to pass through Tavistock. Lydford is in Devon, about seven or eight miles from Launceston. Would it be an advantage to the inhabitants of Plymouth to have to make a circuitous route to Launceston instead of a direct one? I confess that this appears to me to be a very strange and unaccountable reason why the traffic between Plymouth and Cornwall should be lost to the central line; but how would that traffic be kept up—would it be by means of the common roads and conveyances at present in use? Mr. Bond can hardly be ignorant of the false position in which he has placed himself; but having digressed from my original intention, I must leave him to fight his own battles.

The great bulk of the inhabitants of the county are to be found at and to the west of Truro, and as both of the lines are intended to meet at Truro, it will be from that point we have to start. Now, the road to Exeter by the south line through Plymouth, will be twenty miles longer than the central line, independently of the time lost in crossing the Hamoaze. The amount of travelling between Cornwall and Plymouth, compared with that between Cornwall and the other parts of the kingdom, is inconsiderable in the extreme, and even admitting that the journey to Plymouth by the south line could be performed in less time than by the central line, it is a question fairly and strongly urged by the inhabitants—why should we be compelled to travel by way of Plymouth, on our route to London, or the north of England, the distance to Exeter only being twenty miles longer, and a considerable time being lost in crossing the Hamoaze? But when we look at the question in all its bearings, as to its utility to the county at large, then it must be asked, will a south line afford the general accommodation required by the county? upon which there can be but one opinion. If the south line to Plymouth be adopted, it will be thoroughly useless to the inhabitants of the northern parts of the county, as they would save both time and expense in travelling by coach to Exeter; but a central line will accommodate all parties. The south line will pass from Truro, near to St. Austell, Lostwithiel, and Liskeard, on to Torpoint, through a most difficult part of the country. A central line will not deprive those towns of the advantages of railway travelling; it will pass within eight miles of St. Austell, and a less distance from Lostwithiel, whilst it will not be more than twelve miles distant from Liskeard—so that to the inhabitants of those places it will afford a shorter route to Exeter by many miles, and will even carry them to Plymouth in as short a period of time, taking the delay and casualties in crossing the Hamoaze into account; whilst to Bodmin, Wadebridge, Padstow, Launceston, Stratton, Callington, &c., it will afford that accommodation which a south line can never afford. The question, then, is, shall the line be so laid down as to afford the greatest amount and most extensive accommodation to the county at large?—or shall it be carried along the south coast for the accommodation of the few—a very few indeed?

Public meetings, you admit, have been held; but you attach a motive to them which is not true. They have not been for the purpose of endeavouring to win over the parties in connexion with the other line, although they would have been happy to have all parties united in an object of so much importance to the county; but those meetings have been held for the purpose of ascertaining the feelings of those who are most interested in the measure; and few questions have ever been brought before the county in which so much unanimity has prevailed, as in this instance, in favour of a central line. Not only is it the best line for the county of Cornwall, but it will furnish the inhabitants of the north-west part of Devon with a means of communication with other parts of the kingdom which they are desirous of possessing, and will greatly benefit Exeter by bringing a greater extent of traffic to that city. The southern line would be nothing more than an appendage to the tail of the Great Western line, and would be made dependant upon the will and caprice of the parties who have the management of that company. It would, in fact, be nothing more than a branch from Cornwall to Plymouth, to meet a line possessing a monopoly, and to pass on which the passengers must pay just what might be demanded. Expresses are are often sent from Falmouth to London, and as the object is at all times the saving of time, the route to Plymouth being the longest would mar the object; besides which, a command of trains above Plymouth would be dependant upon the feeling of the Exeter and Plymouth Railway Company, who would not be very anxious to facilitate the communications between Falmouth and London, the two ports being rivals to each other in the endeavour to get the packet station; at all events, I would ask, would it be wise in the Cornish people to place themselves at the mercy of the authorities at Plymouth? The central line would go at once to Exeter, independently of any interference from any other party. It would there meet the two rival lines, the Great Western and the South Western from London, and by taking the latter would reach London by a route which will be thirty miles shorter from Exeter than that by the Great Western line; so that a person travelling from Falmouth to London by the central line to Exeter, and thence forward by the South Western line, would save fifty miles in the distance, besides the delay in crossing the Hamoaze. Is this of no importance to the traveller? Then why introduce railways at all?

It is much to be regretted that there should be such an opposition to the central line, which is so universally supported in Cornwall. I have before observed, that the travelling between Cornwall and Plymouth is too a trifle when compared with what takes place between Cornwall and the more distant parts of the kingdom. In proof of this, I would merely advert to the fact, that there are three steam vessels running weekly between Hayle and Bristol, principally for the conveyance of passengers, at which latter place they meet with the Great Western Railway to London, or the Gloucester Railway to the north of England. The passage is generally an unpleasant one, from the disturbed state of the sea, and occupies twice as long a period as the journey direct to London by the central railway would require. Can anything be said more decidedly in favour of the south line than this is in favour of the central line? Some of the provisional committee of the south line have already withdrawn from it, under a conviction of the superiority of the central line, and others would much wish that the central line should be carried into effect. It is, therefore, a matter for serious regret that any opposition to it should continue, as it can only lead to an unnecessary large expenditure of money, by bringing both lines before a committee in Parliament, besides carrying a party spirit through the county, which may never be removed. There can be no disgrace in withdrawing from the south line, under the conviction of the other being a preferable one. They should remember the Cornish motto of "One and all."

One of Them.

*London*, Nov. 21.

FOST OFFICE LONDON DIRECTORY.—We have just had an opportunity of looking into the new volume of this most useful "annual." In speaking of last year's edition, we gave it unqualified praise, and stated our opinion, that, abounding as it did with all matters interesting, we essential, to the commercial community, the Directory could not fail finding its way into the offices of all classes of mercantile men—hence its early patronage this year, the great demand having months since exhausted the stock. In the new Directory, we find many emendations and important additions—the "Street List," for instance, having been enlarged by upwards of 4000 classified names, the list of principal towns throughout England and Wales greatly enlarged, the Postal Directory also most carefully compiled, and the accompanying map satisfying all the latest improvements from a recent survey—in fact, the entire work bears out the remark in the preface, that as London Directory, it was as complete and complete, for one before been produced. We also reading notice one other feature of the preface, as being highly honourable to the spirited proprietor—whose work, from its invaluable nature having become so generally known, would have commanded an extensive sale, though its price had been doubled—that with all the important additions, and being without a rival, the price remains unchanged.

HARRISON'S PATENT IMPROVEMENTS IN IRON MOULDING.—These improvements have reference to the formation of the moulds for cast iron pipes, pillars, and other articles of a cylindrical form. The ordinary method of forming moulds for such articles is, first, to form the core of the article, then to rise up the pattern of the article itself; having mounted it in this condition, the "thickness" is pared off, and the core removed, and the box finally closed. Now, by Harrison's method, two moulding boxes, or "moulds," are provided, which, when put together, are cylindrical, instead of square, as formerly. The latest contrivances of these boxes are attended with peculiarities, as follows, the object of which is to lay hold of the iron or wet sand which forms the mould; this material being laid on in the whole surface by hand. This operation, being performed on one half the box, a piece of board which has been cut on one edge so as to form a profile of the external part of the pipe, and of the outer length, is revolved upon an axis in such manner that the board forms a radial line to such axis, the axis or shaft on which this board or template is attached is then placed into the bearings, which are formed at each end of the moulding box, in such, therefore, be evident, that on giving motion to the axis or shaft, the edge of the board will describe a circle whose plane will be equal to the external surface of the pipe intended to be cast, and will, therefore, form a half mould of iron in the aforesaid box. This operation being carefully performed in the top and bottom parts of the box, the cores are taken to the stove and dried, after which the edges are carefully cleaned off so as to make a good joint, and the surface covered with charcoal, the mould is then ready to receive the core, and after carefully the surface covered with charcoal, the mould is then ready to receive the core, and after carefully the surface covered with charcoal, the mould is then ready to receive the core, and after carefully

## MEETINGS OF SCIENTIFIC BODIES.

### IN THE ENSUING WEEK.

| SOCIETY. | PLACE OF MEETING. | DAY. | HOUR. |
|---|---|---|---|
| Royal Botanical | Regent's-park | Saturday | 4 P.M. |

## PUBLIC COMPANIES.

### MEETINGS.

TUESDAY.—Newcastle and North Shields Railway, at Tyne—Rock Life Assurance Company, at Tyne—Midland Railway, at Tyne.

WEDNESDAY.—London and Birmingham Railway, at Tyne—Cornwallis and North Devon Mining Company, at Tyne.

THURSDAY.—Hull Railway Company, at Tyne.

FRIDAY.—Birmingham Canal Navigation Company, at Hixon.

SATURDAY.—Hungerford and Lambeth Suspension Bridge Company, at Ono.

### CALLS.

Guildford Junction Railway, 5l.—Orleans, Tours, and Bordeaux Railway, 7l.

## NOTICES TO CORRESPONDENTS.

HOUSTON RAILWAY.—J. B. P. and Mr. Shuttleworth reached us too late to appear this week.

DAILY RECEIPTS.—We have delayed the publication of our monthly report, in order to make some necessary alterations.

# THE MINING JOURNAL,

## Railway and Commercial Gazette.

LONDON, NOVEMBER 23, 1844.

Our attention has been drawn by several correspondents to "Act for the Registration, Incorporation, and Regulation of Joint Stock Companies," passed the 5th September last, inasmuch that it is hard to define what is the construction to be put upon the eighty clauses of which it is composed. That it is good in the object the promoters had in view we admit; but that it has been drawn up with a perfect ignorance of the *material* of which an Act of this nature should be composed, must be apparent to the most casual reader. For ourselves, we are free to confess, that, learned as we imagine ourselves in mining "lore," we can neither construe the meaning of its clauses, nor can we offer counsel or advice to others.

To effect the latter, we have drawn up a case for counsel. We may not have minutely entered into the several points, but think we have taken the main features; and doubt not but that we shall be in a position on an early day to reply to our correspondents in a more perfect and legal form than could be expected from any Editorial remarks. We cannot, however, despite legal opinion, allow the subject thus to pass by; and, although we purpose with our next or following Number giving an abstract of the Act, with our comments on the several clauses, backed by counsel's opinion, yet we feel that to allow a week to go over and not to advert to one or two of the principal clauses which more especially pertain to mining, would be a neglect of duty—one which we really impose on ourselves, and which our readers have a right to expect we will perform.

One of our correspondents asks, "Who was the contractor of this Act of Parliament?"—"Who (says he) were the parties consulted?" We can only in reply say, that, accustomed as we are with mine adventures, collieries, quarries, railways, *cum multis aliis*—speculations where capital is embarked—never were we consulted; nor, amongst our numerous connexion, have we ever heard that an opinion had been asked. Thus, then, it would appear, that the Act has been smuggled through the House; and no doubt those who took the most active part will secure to themselves the largest pay. The principle we advocate is that of putting down the *ecrip system* and jobbing, and so far the Government have our hearty concurrence; but we apprehend the curtain has yet to be drawn—while the projected law will be found, not only to be inoperative, but inoperative.

One clause is sufficient for our purpose on the present occasion, and we take the 63d, whereby it is "Provided always, and be it enacted, that nothing in this Act contained, shall extend, or be construed to extend, to any partnership formed for the working of mines, minerals, and quarries, of what nature soever, on the principle commonly called on the cost book principle." Now, we would like to ask the framers of this Act whether they really understood the nature or the object of the Act, but more especially whether they understood, or have the slightest apprehension of, what is the "cost book principle?" We believe not. However, assuming that the authorities were in a state of blissful ignorance of what they were about, let us for a moment say one word on this shortest (and one eighteenth part so numerous) clauses of the Act before us. In the first place, it is said that nothing "shall extend, or be construed to extend, to any partnership formed for the working of mines, minerals, and quarries, of what nature soever." Let us ask what does this really mean?—does it apply to companies or partnerships already formed, or to such as may be formed? This is an important question, and will, without explanation, afford pretty subject for special pleading. The Act says—"formed for the working of mines, &c.," but it says not whether such has reference to companies or partnerships which may already have been formed, or such as may be formed hereafterward; and this appears to us to be one of those omissions or commissions which render the Act inoperative.

For ourselves, we read the Act thus—that "any partnership formed for the working of mines, minerals, and quarries, of what nature soever, on the principle commonly called the cost book principle," may be constituted henceforth without coming under the operation of the Act—while we admit it is hard to determine what is the cost book principle, and whether it does it apply equally to Cornwallis, Wicklow, Derbyshire, and any other county, as well as Cornwall, where such principle is more generally known, but which particular district is not distinguished or entered in the Act, and thus renders the clause uncertain in its application.

If, then, we are right in our position, any company can be formed despite the Act, so that it be termed or entered on as the "cost book system," which much must depend on the construction of the words of the clause, whether embracing the prospective, as well as the past. If the case be as we have conceived the clause, then the Act becomes inoperative, or superfluous, as well as inoperative—while it behoves shareholders in the several adventures to determine what is the "cost book principle." We perfectly understand it, as affecting our Cornish mines, but it remains to be seen how far such is understood to apply to other operations, although the absence of any reference to locality would seem to be equivalent that the Act is intended to be universal.

It was our intent this week to have entered at length on Accidents in Mines and Collieries, and have presented to our readers at one view the fearful catalogue which has from time to time appeared in our columns, but again are we precluded from carrying out our wishes to the full extent. The letters of Mr. MACTAGGART, the Secretary of the South Shields Committee, addressed to Sir ROBERT PEEL, with other communications, crowd a superfluous in doing the space required to so important a subject—while we may, in the mean while, refer to the additional evidence rendered through our columns of the necessity which exists for legislative measures.

With the object of enabling our practical readers the means of judging of the nature of the underground workings at the Haswell Colliery, we have given a diagram, which we believe to be correct, and, with the letter of a correspondent, who acts on the "defensive," will place the subject fairly before the public. Under such circumstances, we have only to direct attention to the several letters and our six months report, to 30th June, reserving the sad account for the close of the year.

It is with satisfaction that we can, on authority, state, Government is taking the necessary measures, and that, immediately on the assembling of Parliament, a bill will be brought in. Let all interested watch it—Government has heretofore been too slothful, let us take care that those who seek office are not too wakeful. For ourselves, the collier and the colliery proprietor may rest assured we are not asleep.

## COLLEGE OF CHEMISTRY.

We have had our attention drawn to the contemplated establishment of a College of Chemistry, for promoting the science and its application to agriculture, the arts, manufactures, and medicine, the provisional committee consisting of a number of noblemen and gentlemen of the first standing in society, and who have ever put themselves forward in the cause of science, among whom will be found the Dukes of Wellington and Sutherland, Marquis of Lansdowne, Earls Essex, Dalhousie, Clarendon, Durie, Radnor, and Fitzwilliam, Lords Monteagle and Portman, those distinguished geologists Buckland, De la Beche, and Murchison, and many others. The object is to establish a school of chemistry, where analysis and research are taught practically and systematically, and where the education of the scientific chemist may be completed at a moderate expense; and, while the council acknowledge the laudable endeavours which have been made to extend a knowledge of the elementary principles of chemistry over the community by mechanics' institutes, and popular lectures, they observe that the student who may wish to adopt chemistry as a profession finds here no means of so doing, except by private tuition, or by resorting to some practical school on the continent; the expense in either case, and in the latter the obligation to learn the language, deter those of small pecuniary resources from availing themselves of their aids, and thus many most promising students are compelled to abandon it, and seek some other profession. A careful and minute investigation into the establishment and working of the continental schools, especially that of Giessen, has demonstrated that in this country a practical school of chemistry cannot exist self-supported—viz., dependent upon the fees paid by the students, but that funds must be obtained from some extrinsic source; the council, therefore, confidently appeal to the public for subscriptions and donations, considering that such an institution will be a great national benefit, and trust the Government will eventually afford their assistance. That there is not only ample field for the establishment of such an institution, but that it would ultimately become of first-rate importance, the facts detailed in the prospectus, as to the present means of instruction to those who are anxious to devote their time and talents to this fascinating science, fully convince, and donors and subscribers will find that they have not only promoted a public good, but with the legitimate expectation of an immediate and adequate return for their investment.

## NEW MACHINE FOR THE DESCENT OF MINERS.

REPORT OF M. DUMOT TO THE MINISTER OF PUBLIC WORKS OF BELGIUM.

Having been assisted by M. Warocqué, one of the chief proprietors and a director of the collieries of Marimont and L'Olive, at Morlanwelz, to examine a machine of his invention for the descent of miners, I went accordingly last week to Marimont, and now have the honour to lay before you the result of my visit. The model of the invention of M. Warocqué, which has been constructed by him on a small scale at his establishment, and which he intends shortly to execute on a much larger scale, has an excellent object in view—that of relieving the miners from two great inconveniences—viz., the chance of accidents, and excess of labour. It is based on the same principle as those constructions of a similar kind which are said to exist in Germany—that is to say, on the alternate up and down motion of two vertical rods, to which are attached at certain distances platforms, on which the miners successively come to rest; but, beyond this, the method of M. Warocqué presents to us a complete system, the success of which can hardly be doubtful, and of which I shall now give you an idea by a succinct description. Let two continuous rods, of wood or iron, be established at one metre, or better at 1 metre 50 cents., from each other, and from the top to the bottom of a vertical shaft. Each of the rods must be furnished every six metres in distance with a platform or landing of wrought-iron or planking, which will occupy one half of the section of the shaft comprised between the two rods, and which, except in the diameter of the shaft, must be furnished with a rail round it to prevent the falling off of the workmen. The shaft will be provided also from the top to the bottom with a vertical ladder, of which the miners can avail themselves in case of the apparatus not performing. In this manner, and the landings being opposite each other in the same level, if we give an ascending motion of three metres to one of the rods, and a descending movement of three metres to the other, it is easy to conceive that the superior or upper landing of the first rod will be found six metres above the superior landing of the second, and that the inferior landing of this will be found at six metres under the inferior landing of the first, all the other landings being at the same level; if, now, a workman should place himself on the highest of the landings of the surface, and another workman on the lowest landing at the bottom of the mine, the former may, when the two rods shall be brought to their first position, will have descended three metres, and will be able to take also, by means of a grasy plant one high such landing, the corresponding landing of the second rod—whilst the second workman, on the contrary, will have ascended three metres, and will be able to take the corresponding landing of the first rod, and so afterwards, at every oscillation of the two rods; thus in ten minutes, for instance, the two workmen, without running any risk, and without any further trouble than that of changing the landing at every three metres, will have arrived, the one from the surface to the bottom of a shaft of 300 metres, the other from the bottom of the same shaft to the surface. By this arrangement, it is clear that nothing but the depth of the shaft could limit the number of miners who could ascend and descend one after another, as these men would form, by their own weight on the two rods, a vertical equilibrium. The means by which M. Warocqué gives this up and down movement to the rods is, indeed, very ingenious; it consists of a bent cast iron tube, whose two vertical branches, on each of which moves a full driving piston with a wooden or leather box, are placed vertically above the rods. Into storage fixtures the rods to the plunging pistons, one of which receives the motion of a steam engine of direct traction. The piston of this machine is fix the rods and the two plunging cylinders, these motion is extend. The water which fills the tube transmits the vertical movement of one plunging cylinder to the other, but in an inverse sense—that is to say, whilst one of the cylinders controls the other downwards, and vice versa. I thought it would be agreeable to you to know, in the manner I have described them, the principal arrangements of an apparatus, which, if only conducted on a large scale, will assuredly have the most happy results, as well for the safety of the workmen, as for the economy which it will effect in the working of mines. However, I must here turn the honour of mentioning that M. Warocqué is not the first who, in the province of Hainhault, knew how to profit by the up and down motion of a vertical rod for introducing workmen into the mines, and bringing them up again. In January of the present year, M. Lambert, conductor of the mines, when engaged in the first district of Mons, has applied with complete success, with some modifications, the process used in Germany, at the shaft of pumps of the collieries of St. Croix, Sacre Chain, at Dour. For this purpose he has adapted to the principal rod of the pumps, and at equal distances in its course, a series of iron steps or pattens, and vertical groups of from fifty to sixty continuations in length, so that the workmen might easily seize them, notwithstanding their difference in stature, by placing their feet upon the platform. Thus they descend or they ascend by 2 metres 50 cents. at each oscillation of the rod, by placing themselves to be 2 or second or in descend, in a succession of vertical steps firmly attached to the side of the shaft, and the length of the rod from the surface down to the bottom of the mine.—*Translated from the Mouniteur Industriel.*

## ORIGINAL CORRESPONDENCE.

### ACCIDENTS IN MINES—SAFETY LAMPS.

SIR,—In your Journal of the 9th instant, I read a letter, signed James Codman, refuting the propriety of Mr. Bagnall's suggestion, which appeared in a former Number, respecting the issue of an improved safety lamp being conducive to the greater safety of the miner of the northern collieries—also, stating that a better mode of ventilation was, in his opinion, more to be desired. This I beg leave to grant, as I feel confident such a treasure could not be objectionable to any one engaged in mining operations—at the same time, I must observe, that, so far as I can judge, an improved safety lamp, contrary to Mr. Codman's opinion, must be a treasure of the highest value, and extremely conducive to the greater safety of the miner. With all the improvements derived from science in the ventilation of mines, the lamp is still the pitman's only protector, and until that day shall arrive when the ventilation of coal mines will be so perfected as to dispense with its use, then may improvements be dispensed with—but not till then. A wish is expressed by Mr. Codman, that if some intelligent person would furnish Mr. Bagnall and others with a sketch of the workings of the pit in which the late melancholy accident occurred, these persons would thereby be enabled to form an opinion as to the safety of that pit, and whether its present mode of ventilation is that best adapted to the state of science, and the local circumstances to be estimated by every intelligent engineer. Now, I cannot but think that there is an overweening presumption in this remark, tending to show that some pit of Mr. Codman's can, by a slight inspection of the plan, overthrow the mass of authorities that have already given judgment on the cause of the late very distressing accident. Does Mr. Codman know the character and eminence of the individuals who have already pronounced an opinion on this question? Can he be foolish enough to suppose that any one, from a sketch such as he speaks of, will be enabled to give the public something that will invalidate the strong testimony already so clearly and so ably given? If he do so, I beg leave respectfully to furnish him with materials upon which he, "Bagnall, and others," may try their hands.

I would first premise the evidence of some persons who have been deemed competent to form an opinion on this question. First, Mr. Edward Boyd, connected as viewer with fifteen collieries. In his evidence, he stated that Haswell Colliery was the best ventilated colliery he knew, except one, which he thought was equal to it, and that at Haswell nothing had been left undone which, in his opinion, could have been done to prevent the accident. Second, Mr. Nicholas Wood, viewer of many collieries—a gentleman of long experience, eminent for his genius, and high practical talents. This gentleman's evidence gives a most vivid sketch of the workings and air courses at Haswell Colliery, and most unequivocally confirms the testimony of the former witness. Third, Mr. George Hunter, extensively engaged in the profession, of high standing, and long experience, establishes, in terms equally strong, his impression as to the care, expense, and intelligence, everywhere observable in the ventilation of Haswell Colliery. Lastly, Mr. Samuel Stutchbury, deputed by the Government to inspect and report upon this colliery, declared that he was astonished at the expense and labour that had been bestowed for the purpose of ventilating the mine—that in his opinion nothing had been spared, nothing left undone, for the effecting a due and sufficient ventilation. This last gentleman was accompanied by Prof. Faraday, Mr. Lyell, and several other gentlemen eminent for their scientific attainments, and a complete knowledge of the latest improvements suggested or adopted in the working of mines. In contrast with such authorities, what is Mr. Bagnall, or who are the "others" whose opinion is of such consequence, that we must suspend our judgment till favoured with their decision? It must be no men disguised "in buckram," no pet of a coterie, no village philosopher, whose judgment when presented to the public will outweigh the evidence here adduced. But, as before mentioned, in order that Mr. Codman, Mr. Bagnall, and "others," may have an opportunity of displaying their powers, and trying their sufficiency upon the world, I shall here, as above stated, present them with a plain sketch of the air courses, as given in the evidence of Mr. Forster, and depicted in the plan of Haswell Colliery. It is thence to be gathered that the air is carried through the different avenues, or openings of the mine, in the following channels:—The Engine Pit and Little Pit workings form the colliery, and are both ventilated by one downcast and one upcast shaft, forty yards asunder. The downcast shaft is twelve feet in diameter, and the upcast nine and a half feet in diameter. At the bottom of the downcast shaft the air is divided into two columns—the Little Pit workings receiving 37,730 cubic feet per minute, the Engine Pit 35,000—making the total quantity descending the shaft 72,730 cubic feet per minute. The column which supplies the Little Pit proceeds along the main rolley way about 600 yards, at which point it is divided. One-third, or about 2000 cubic feet, of the above quantity, is here taken for the purpose of ventilating the north western districts of the mine. The remaining three-fourths of the column, about 29,060 cubic feet, proceed forward to what is called the Meadows Way end, at which point it is again divided. One-third, or about 3000 cubic feet, is taken to ventilate the Meadows workings, in which workings the miner is supplied with the safety lamp. With such precautions, I cannot entertain a doubt that a column of atmospheric air, in the condition in which it must here be found, would be amply sufficient to ventilate a district of much greater extent. This current is next impelled through what is called the goaf, which is the part where the whole of the coal has been taken away, and the ceiling thereby let down. If in any part of a pit gas is generated, that is usually reckoned by judges the conspicuous quarter; yet, long after passing this place, and at the last general return, where all the impurities should be accumulated and condensed, Mr. Nicholas Wood stated that upon examination he could not detect its presence. From the Meadows Way end proceed 19,000 cubic feet of air to what is called the High Brockly Whins flat, at which point there are two divisions, one to the left, and the other to the right, for the purpose of ventilating the pillar working. Following the main current there, proceed about 12,000 cubic feet, which, after a progress of about 100 yards, is equally divided betwixt the workings of the right and left-hand sides. The sketch at this point indicates eight boards, or openings, on the left hand side, four yards wide, and about twenty yards apart, striking off at right angles to the main headway. Along the headway proceed 6040 cubic feet of air per minute, which column ventilates these boards, or openings. That the whole of this column is considerably not directed through these boards must be obvious for the following reasons:—First, in the most complete ventilation elsewhere, one third is reckoned superfluous; and, next, if driven through these openings, the miner, from its chilling effects, would be rendered incapable of performing his work. Here is exhibited in abundant surplus, confirming the statement of Mr. Hunter, that "Haswell pit has a greater quantity of air passing through it than any other colliery he had ever seen." In describing the one side of the main current, we have described the other and opposite one, and collecting now in what is called the principal return drifts or openings, these currents united once more to the before mentioned upcast shaft, at the bottom of which two extensive furnaces, by their heating and rarefying effects, produce, as stated, the great and uniform velocity of eight miles an hour.

Hoping, Sir, that in a subject necessarily dry to the public taste, we have been as little tedious as possible, we would respectfully submit the situation of Mr. Codman, Mr. Bagnall, and the "others"—"good men and true," we doubt—to the problem, asserted and still imposed, contained in the above paragraphs. If, from the description here given thus, they shall be enabled to devise such measures as shall for ever prevent the recurrence of such another dreadful catastrophe, then, "above all Greek, above all Roman fame," be the name of Codman, Bagnall, and "others," eternally recorded! If the Davy lamps be converted into snuffers, the pensions that have been awarded Davy, Faraday, and the rest of that illustrious band, be more properly devoted to *le Pauvre* to the greater extent of Codman, Bagnall, and the "others." Should, however, this "consummation so devoutly to be wished" not be attained, but should it, upon the most careful and diligent inquiry, be found that the utmost the skill, humanity, and a British enterprise, can accomplish, has already been attempted, then to the praises of united from female philanthropists, mortified Chartists, and all that hold close the ladies upon compensation, will intermixed overtures, breathing their genius to the full as welcome as the fond hydrogen into the ears of the unfeathered and unscrupulating victims—ah, I say, the prayers be directed to those who, having already taken every precaution, are still unanimously of opinion that the surviving sufferers by the late explosion have wherewithal to maintain, comfort, and keep them warm, in the their hour of adversity.

Nov. 21. A FRIEND TO ALL.

Some remarks will be found in another column. The sentiments, contained, and warmth, to the surviving sufferers, is highly creditable—but this is not sufficient. "A Friend to" appears very too much private with the friend of the working miner under the guise of an author of numerous, while the subject, although commented upon by one evidently knowing his ground, is treated with a flippancy (if we may use the expression) which we regret to observe.

## REGISTRATION OF JOINT-STOCK COMPANIES.

Sir,—Since the publication of my letter, in last week's *Mining Journal*, I have perused more than one analysis of the Joint-Stock Companies' Act; but, with all deference to the learned essayists, I would plainly say, that there is a defect in their dissertations—for they all fail in indicating intelligibly to the public the true nature and extent of the *exceptions* to the Act, so rigidly recited in the second section. The mind of the legislature is, I think, simply as follows:—All joint-stock companies are now, to be placed under peculiar, and even penal, regulation, but companies for executing certain specified public works are to be exempted when they are incorporated by means of a special Act for each company. Until an association of persons for "executing any bridge, road, canal, railway," &c., is recognised by Parliamentary sanction, it is not, in fact, a bridge, road, canal, or railway company, but a joint-stock company in what may be termed a transition state, and as soon as the Royal Assent is obtained, the newly established railway company is to be governed by the provisions of their own Act, *not* by the Joint-Stock Companies' Act, unless by virtue of some provision introduced into the railway company's Act. There is so much legal mystification in the present day, that it is very difficult to arrive at the common sense construction of statutes. Thos. Mulock.

P.S.—In my last letter, line 13, the section of the Act referred to should be the 24, and not 23d.

## NEW REGISTRATION ACT—MINING COMPANIES.

Sir,—In the Act passed during the last session to enforce the registration, incorporation, and regulation of joint-stock companies, I find that by clause 63 all mining companies conducted upon the "cost book" principle are exempt from the operations of the Act. Now, what is meant by the Legislature by the cost book principle is not set forth in the Act, and I take leave to suggest to you, that although it may be generally understood, there are a great number of your readers who have not correct information on the subject, and that you could not, at this juncture, render them a greater service than by defining the true intent and meaning of the term. If it would not be taking up too much of your space and time, you, perhaps, would be so obliging as to furnish to your readers a form of the books of a mine worked on that principle, with the usual heads, and filled up with nominal amounts; also to inform your readers whether mining companies established, or that may be established, with fixed amounts of capital, divided into 1000, 5000, or 10,000 shares, may be worked upon the cost book system, and thereby excluded from the operation of the Act.—*City, Nov. 20.* Enquirer.

[We had already directed our attention to the subject antecedent to the receipt of the letter of our correspondent, and hope next week to give the opinion of counsel on a case we have prepared, having reference to the several clauses in the Act. As regards the particular point on which an "Enquirer" asks for information, he will find it noticed in another column.]

## NEW PLAN FOR THE VENTILATION OF MINES.

Sir,—Enclosed I beg to hand you a copy of my letter on the ventilation of coal mines, by the application of the fan blast, as published in the *Newcastle Advertiser*, and which I should feel obliged by your insertion in the *Mining Journal*, together with the accompanying additional remarks:

"The late melancholy accident at Haswell Colliery proves that the present system of working mines is behind the spirit of the times; it might have answered well enough some fifty years ago, but now that the northern coal trade has swollen to such dimensions, and mines are worked and explored to such extent underneath, it behoves every one who understands any thing of the matter, or who thinks he can suggest improvement, to speak out. In this spirit I submit the following mode of ventilation to your readers:—A powerful fan blast, driven by a steam-engine of 50-horse power, one set of fans, 4 ft. 6 inch. diameter, eleven inches broad matting, 900 revolutions per minute, will produce 57,600 cubic feet of fresh air per minute; the above engine will be capable of driving ten fans, producing 576,000 feet of air. Now, the quantity of air descending the shaft of Haswell pit, according to newspaper reports of an inspection by N. Wood, Esq., was 74,228, being less than one-seventh of the quantity which could be forced down under my plan, which would drive out completely and dislodge all noxious gases. The fan blast could be erected convenient to the shaft, and proper air courses and pipes attached from thence down the shaft; they might then be carried underneath the bottom, even the most intricate, working on the principle of gas or water pipes, with large taps. It is needless to add, that, with such quantities of air playing on the men during work, an explosion would be next to impossible; but if, from some unknown cause, a trifling explosion should take place, the workmen that were unhurt might escape in safety, as the blowing down of the stoppings would not, in this instance, impede the progress of the air in its ventilating process, which would effectually clear away the after-damp."

The benefits which would result to the working miner from the adoption of the above plan would be chiefly three, viz.:—1. As great a security of human life as that enjoyed by any other workman engaged in dangerous and laborious occupations. 2. The enjoyment of that (to the working man) greatest blessing—a sufficiency of light in which to work, the danger of explosion being removed—he being no longer, as at present, compelled to work in the almost obscure light of a Davy lamp, which only makes darkness more visible. 3d. A sufficient supply of fresh air, to inflate the lungs of the miner, from which he would derive the oxygen of life, instead of breathing noxious gases that war with elements of flesh and blood, and sweltering in perspiration still cool dust, as at present.

I hope and trust that my plan may get a fair trial—it is not Utopian—it is the result of a lengthened experience; and I would deem it a great blessing to humanity, if I should live to see it accomplished. Some objections have already been taken against it; this, as a matter of course, was to be expected; but, in order to silence cavil, I may state, that I propose making such improvements and additions in the fan blast, and also in the dimensions of my air courses, as, I trust, will effect the purpose I have in view, and carry air for ten miles underneath, as well as for as many yards. Should any of your correspondents require further information on the subject, I shall be happy to afford it according to my ability.

*Hedley street, North Shields, Nov. 14.* Wm. Dowse.

## MR. SAMUDA—"SPIGGOT AND FOSSET JOINTS," &c.

Sir,—The melancholy accident, which deprived the world in a moment of so many able engineers and engineers, and the recent awful steam-boat explosion in the United States, furnish additional proofs that the necessary precautions for the safety of human life during the application of the tremendous power of steam are, to a considerable extent, still disregarded. From the reported evidence on the inquest as to the catastrophe on the Thames, it appears that the bursting of the "spiggot and fosset joint," which is used to allow of the alternate contraction and expansion of the iron without fracture, and for the effect which would otherwise be produced by the motion of the vessel, in relation to the piston and the steam pipe, was the cause of the calamity. It seems that the joint is somewhat like that of a common street gas pipe, and packed in a somewhat similar manner. It is not impossible that the steam valve might have been gagged by galvanism or electricity in addition to its pressure weight, and the attraction of cohesion in a deep collier ground steam-flight; and it is evident that the (comparatively subordinate) pressure of the just up steam forced out the joint, the elastic power acting on the ends or returns of the pipe, and thus bursting the joint itself. If the "spiggot and fosset" be the *best*, I would propose that it should be guarded by an outer case or jointed pipe, so as to allow sufficient space for expansion and contraction, or that some substitute be adopted.

As to American explosions, as a small mile, they are every day effects, but the last reported "pure blind" to point of destruction of life. It seems that parts of the boilers which were found in the bodies of men were burnt very thin, and that the usual inquestes had not been attended to. Why should not *hydraulic* pressure be applied as a test to the boilers of steamers, after they have been used, occasionally, as well as before actual steam trial? The phenomena of explosion is a subject which has not yet received the attention which it merits, considering the awful consequences involved. The ordinary "safety" or rather destruction valve is evidently not a sufficient security. A mere line, as I suggested some time since—that is to say, a valve resting on a tapered edge of a pipe projecting from the boiler, or resting like the cones (my mille rise) of a common earthenware mustard-pot on it, with side guides, would, perhaps, be an improvement, the common plane weights, with a hole in their centres, being placed as desired on a vertical rod fixed in the centre of the valve, instead of the sliding lever weight now used. Andrew T. J. Maceo.

*Penzance, Nov. 19.*

## "SHORT" IRON.

Sir,—Repudiating all intention of entering into the comparative merits of Scotch and English iron, or hot and cold-blast, I would merely venture to record my firm and decided opinion, that, in particular cases—as in the instance at Oldham—cast-iron should not be trusted. It is always crystalline in its texture, and, therefore, more or less brittle, according to the circumstances under which it is prepared, in reference to the character of the ore, the flux, ratio of cooling, and admixture of extraneous matters. A specimen of native iron, somewhere in my possession, is fibrous in structure. In the case of axles, and the like, rods or plates of iron should be twisted together, and united by welding. It is in this way, I am informed, that the famous "Damascus blades" are made, and that their vast superiority is not merely connected with the individual character of the *wootz*—though that, too, may contribute something to their value. Many specimens of fine Swedish steel, I conceive, may vie with ordinary Indian *wootz*. I believe, too, that the pliancy and other properties of the Spanish "toledo" are also assignable to the mode of working the steel, and twisting the plates or rods together. The sword presented by Mr. Sowerby to the Emperor Alexander, and manufactured from the meteoric iron of Siberia, was, if I recollect aright, very flexible and elastic, arising, no doubt, from the fibrous structure of the material. I merely wish to recommend the old adage—"A threefold cord is not quickly broken"—to the case of working in iron. The cohesive strength of the individual film may be feeble, but the aggregate of numbers, twisted together, as in the rope, may defy a powerful shock.—*Nov. 20.* J. Murray.

## SULPHURETTED HYDROGEN.

Sir,—I have already mentioned the facts stated by Dr. Ryan, and recorded in the *Mining Journal*, respecting this virulent septic poison, in my *Skiffich of Chemistry*. When in Paris, I remember, four persons were withdrawn from one of the public sewers of that city in a state of asphyxia—victims to this gas—two of whom were eventually recovered by the judicious administration of chlorine; and I remember, too, that the Baron Thenard, on one occasion, having introduced a greenfinch into atmospheric air, impregnated with about 1-1400th part of its volume of sulphuretted hydrogen, the bird seemingly perished, but immediately revived on being withdrawn, and its beak held over a phial containing nascent chlorine.

*Nov. 20.* J. Murray.

## CONSOLIDATED TREIOIL MINING COMPANY.

Sir,—I have much satisfaction in apprising the shareholders, through the medium of your columns, that a requisition highly respectably signed to the extent of more than one-third of the shares has been sent in to the directors, requesting that a meeting may be called, which, I presume, will be duly advertised. Having accomplished my object thus far, it must be left with the shareholders to act as they deem best—while they may safely reckon on my humble assistance as a shareholder. H. E.

*City, Nov. 21.*

## ENQUIRIES ON MINES AND MINING MATERIALS.

Sir,—I have often read in your Journal the opinions of geologists and mineralogists, as to what this globe of ours was, is, and will be (for my own part I am content to take it as I find it), but I do not recollect ever seeing what I now ask for—viz., where are the following metals found in the greatest abundance, and what are their general uses—copper, tin, lead, zinc, antimony, cobalt, manganese, nickel, and sulphur? I am induced to ask this favour from you, because I may rely on having simple and intelligible truths, and freed from the mystical notions of some geologists and mineralogists. I live among working miners, and know that that worthy body of men would, for the most part, be equally thankful with myself for the information. As I reside in a mineral district, I am associated with miners, and have frequent discussions on what is found in your useful paper, as to mines and mining in general, and am much benefitted thereby.

I shall also be much obliged if you will be kind enough to favour me with a few clear explanations as to where tallow, hemp, oils, and such like articles, connected with mines, come from, and how and where manufactured; also, from whence we get the timber used in our Cornish mines; also, some information as to the manufacture of steel, brass, and zinc, would be acceptable. I am sure you will cheerfully give the information I ask for, and let me assure you that it will be thankfully received, whenever you have a corner that is not pre-engaged with the learned articles of such of your correspondents who frighten us Cornishmen with reports of "extraordinary looking lodes, eighty feet wide, and towering crest-like to the height (in many places) of twenty fathoms," but of which monster formation (or the writer calls it) I have heard nothing further.

*Truro, Nov. 11.* A Constant Reader.

[In answer to our correspondent, we may observe, that copper is found in almost all parts of the world—while the supply to our home markets, and export from this country are principally confined to the ores of Cornwall, Ireland, Cuba, and Chili; tin is principally found in Cornwall and Banca in the East Indies; lead in North and South Wales, Derbyshire, Cumberland, Westmoreland, Yorkshire, and other localities in England, besides other parts of the globe. The ores of zinc are found in extensive deposits in Cornwall and the Mendip Hills, and in Silesia and other continental mining districts—sometimes much to the annoyance of miners when working for other ores; and antimony, cobalt, manganese, and nickel are found associated with other metals, under various circumstances, in all mining countries. Sulphur generally accompanies all the metals; the large sulphur lode of Wheldon, and running for several miles, is remarkable. Tallow and hemp from Russia; oil from the North and South Seas and the whole of the south of Europe, of various kinds. We should recommend our correspondent, however, to obtain an *Encyclopædia Londinensis* and a few good elementary geological works, from which he will find much satisfactory material for many a long winter's evening.]

## BENEFIT TO THE WORKING CLASSES WITHOUT EXPENSE.

Sir,—Now that "Baths and Wash houses for the People" are drawing so much attention, it may be well to suggest that in selecting the sites of such edifices, preference should be given, whenever the opportunity is afforded, to situations immediately contiguous to works regularly employing large condensing steam-engines. Such engines throw off a large quantity of condensing water fully at blood-heat; and I would propose that the proprietors of such establishments should be requested to give this water—or much the larger portion of it which runs to waste—for the use of the public baths. Common benevolence, I should imagine, would induce them to comply in the most handsome manner, to this most reasonable request, and even to enter into an agreement to allow this water to flow to the baths for a lengthened period.

Such an arrangement being once completed, would justify the committee in laying down pipes to conduct the water to their establishment. If these pipes were well laid in some non-conducting material, such as sawdust, the water might be brought a considerable distance without much loss of heat; and the immediate contiguity of the steam engine, or steam-engines—for the supply might be brought from more than one—would then become an object of less moment. The new dock I have just mentioned would require smoking to a brick drain covered with asphalte, to protect it from moisture; or, if the pipe were supported at proper distances (somehow, I might almost term it) in such a passage, the object in view would be accomplished, provided the air were not allowed to escape, so as to create a cold current through the drain, as that element is a very bad conductor of heat.

The moderate expense of laying the pipes having been provided for, it is obvious, each of these excellent establishments for the benefit of the people, as could have these advantages, would be supplied with pure hot water, at no further expense whatever.

I think the tenantrymen of the waterworks companies also should be appealed to. No doubt it will; and if they unanimitted to give, I flatter myself they will forward the element at first cost price—that is, calculating only the small charge the baths would occasion, additional on the ordinary expense of working the powerful machinery, employed in throwing forward the supply of water from their respective districts.

*Nov. 19.* Mechanicus.

M. Millon has discovered a new combination of sulphur, chlorine, and oxygen, the proportions of which are of great importance in the immaterial transformations of mineral compounds. This new compound is obtained by passing a few drops of chloroxide of sulphur into liquid chlorine. These then appear transparent crystals, which are immediately changed if brought into contact with water. These crystals left to themselves in a well-closed iron tube are transformed in a few months into a thin liquid, which will not congeal at a temperature of 18° below zero.

## LAND DRAINAGE.

The importance to be attached to any measure which tends to the relief or assistance of the agriculturalist, is of too much moment not to call for a passing remark, when any project is brought before the public which has in view so desirable an object. Among the many projected measures, which have from time to time been brought forward, none appear to us to possess greater claims on the attention of the capitalist, the landholder, and the tenant, than the application of capital to the drainage of land, whereby the estate is not only rendered of increased value in the ratio of 20 to 30 per cent., but the increased crops derived from which may be supposed to enhance the value of the farm to the tenant at least 10s. per acre, and thus on a moderate estimate, afford him a surplus such as to be highly remunerative for the capital employed. In many cases, we are aware, that the advantages attendant on a proper system of drainage is not only duly appreciated, but is acted upon either by the landlord or tenant, or by a union of interest. The main point, which at the present moment would appear to occupy the attention of the agriculturalist, is the dressing of the land and the employment of guano or some other admixture of animal, vegetable, or chemical product, so as to increase the crops, and this deserves every encouragement; but, inasmuch that the land becomes again impoverished, after a lapse of time, a renewed application of the guano or other manure hence becomes necessary. Now with land drainage, once effectually done it is done for ever—land which before would not give a blade of grass becomes with ordinary attention to the surface operations, highly productive; and money thus invested is not daily or yearly being reduced in capital, but is daily improving the value of the property, and adds not only to the wealth of the tenant but the security of the landlord.

The difficulty which, however, presents itself in too many cases, is the capital required effectually to drain any extent of land, while, if it be only partially done, the expense is proportionately greater, and the advantages in the same ratio lessened. Again, any capital expended for this object is literally dead, and not, as in the case of dressing ground, which gives its crops for the succeeding two or three years, is, if well done, an improvement to the property, which may be considered as extending over the term of a tolerably long lease. We find, in many instances, that the landlord is content with the rent he receives, and as he cannot increase his rent roll by improving his estates, or affording encouragement to his tenantry, too frequently leaves to his steward the management of his estate, or rather, we should say, the collection of his rents, regardless of the interests of those who hold leases, and, in many cases, purchasers, at a rack rent. It is true that there are exceptions—many honourable exceptions—where the landlord considers his interests interwoven with those of his tenantry, and encouragement is afforded in many forms; but, as it appears to us, we repeat, none present themselves so tangible, so readily to be understood and appreciated, as that of affording aid by means such as present themselves by the drainage of land—thus not only assisting the farmer, and enabling him to meet the rent day as it comes round, but secures to the landlord its ready and cheerful payment, while his property becomes enhanced in value. It may be said, why should the landlord be called upon to make this outlay, more especially in cases where a beneficial lease has been granted, while the tenant in another case may, with just grounds, complain of high rents, light produce, and small returns, and however willing he might be to improve his farm, perhaps possesses not the means.

All this we can readily understand, and it is with the view of directing the attention of landlords and tenants (but we are indeed to take up the subject on the present occasion, having before us the prospectus of a company, which has for its object the advance of money (secured upon the estates) for promoting the drainage of land in the West of England and South Wales. The value to be attached to an association of this nature, if properly conducted, (for all hinges on that), can hardly be too highly appreciated, as affording not only security to the landlord but increased profit to the tenant, while employment is afforded to the labourer, not only in effecting the object in the first instance, but in the increased crops and the beneficial results necessarily arising out of an improved system.

From the prospectus before us, it appears that an influential body of gentlemen have associated themselves as a provisional committee, for affording to the landowners and the farming community of the West of England and South Wales the advantages to be acquired from the employment of capital to the purposes of drainage. A brief abstract of the objects of the company will best convey to our readers the main features which it presents, and, with the best wishes for its success, as being calculated to afford that assistance to the agriculturalist, of which, in too many instances, we fear, he so much stands in need, we take our leave of the subject for the present.

The object of the company appears to be that of rendering facilities in the draining of land, by affording such object in the most economical and perfect manner, or advancing capital for such purpose—the amount so advanced being repaid by instalments, according to agreement; while, by the Act of 8th and 9th Victoria, the owners of settled estates are empowered to charge their lands with the advances so made. It is hardly necessary to observe, that in the prosecution of the object of the company labour will be afforded, which must have the beneficial effect of relieving the distress which, in too many instances, unhappily prevail in the agricultural districts, while the operations of the company cannot fail to benefit both landlord and tenant. As regards the capitalist, it must be apparent, that a company of this nature is not speculative in its character, but rather assumes one of advancing sums on mortgage, while it is to be remembered, that the sums so advanced are not applied to the discharge of incumbrances, but to the improvement of the soil, and hence increasing the value of the property in a ratio proportionate to the outlay. The improved mode recently introduced for the manufacture of tiles enables them to be rendered at one half the cost for which they have hitherto been obtained, while the capital of the company will naturally command peculiar advantages, and, while it affords aid to the landowner and tenant, cannot fail to yield a large profit to the shareholders. The capital of the company is 250,000l., divided into shares of 25l. each, on which a deposit of 2l. is payable on allotment.

## THE ATMOSPHERIC SYSTEM.

A report on the practicability of adopting the atmospheric system on the High Peak Railway has just appeared in a small pamphlet, by Mr. Leonard, the able engineer to the line; the report was made in conformity with the directions of the committee of management, and enters very fully and lucidly into the merits and demerits of its applicability to this particular line. After noticing its peculiarities of operation in contrast with those of other railways, and briefly but admirably describing its construction and principles, Mr. Leonard proceeds to consider the practicability of its application to the line in question, and, as an adjunct to a long single line, with a minor long-an tunnel, he thinks it would be an experiment of doubtful success; but confined to the inclines where it does not require that trains should be transferring to opposite sides line, and to situations where good gradients cannot be obtained, it offers advantages which are not found, or could be accomplished as well, or safely, or economically, or by any other system of power known. After mentioning the kind attention received on inspection of the Dalkey atmospheric line, he proceeds to inquire—first, to the mechanical practicability; second, to the comparative cost of power; third, to the working expenses, wear and tear, &c.; fourth, to the requisite permanent outlay; and lastly, to the more prominent advantages and disadvantages. With respect to the first, he found the working parts most subject to wear, by no means complicated, or made of other than the most common materials; consequently, not easily deranged, or requiring other than common workmen for their repairs. With respect to loss of power from leakage, he compares it with the friction of a rope of iron, and, from various communications, concludes, that the loss by leakage in the one is equal to friction in the other. Coming, then, to the third inquiry, the working expenses, wear and tear, &c., on the High Peak line; they have upon actual cross of work, 1000 pulleys, rollers, &c., which, with rollers, Mr. Leonard calculates at 600l. per annum; while on the atmospheric plan, their working gear, in proportion to the Dalkey line, would cost about 100l. 10s. per annum, or an annual saving of one half. As to the requisite permanent outlay which would be required in changing from one system to the other, the interest of capital required would increase the annual expenditure 1000l. per annum. In comparing the advantages and disadvantages of the two systems, he does not consider that a mere mechanician that would compensate for an additional outlay of 20,000l., and there are some circumstances under which they present plus to perfection; and somewhere with the opinion that the line in the present state would not be benefitted by the application of the atmospheric plan, has adverse, that if certain improvements in the railway were effected—viz., reducing the curves the engineer thinks due to a radius of about one-quarter of a mile, and the Hindlow incline, and straighten that part between Hindlow and Ladmanlow, to carry the whole with straight tunnel of moderate ratio, and connect one end with the North Midland and the other with the M. Junction and Birmingham Superior; with these improvements, even with the ordinary addition of capital, the new system would, as a profitable speculation, place the line in a better position than in the present state it has ever stood.

## PROCEEDINGS OF PUBLIC COMPANIES.

### BRITISH IRON COMPANY.

The half-yearly meeting of this company took place on Tuesday, the 13th inst., at the offices of the company, New Broad-street, City.

J. Horsley Palmer, Esq., in the chair.

The advertisement calling the meeting, and the minutes of the last meeting, having been read,

The Chairman said, he was sorry to have to apologize for the absence of Sir George Larpent, who was out of town; he then read the following report to the meeting:—

REPORT.

The present is a half-yearly general meeting of proprietors, held in pursuance of the Deed of Settlement and regulations of the company.

A board of the receipts and disbursements of the company in the half year ending on the 6th July last, and the balance sheet of that date, both signed by two of the auditors, are laid upon the table.

The balance sheet shows the following as the state of the company's affairs at that period—viz.:

| | | |
|---|---|---|
| Debt due by the company on promissory notes | £106,613 0 0 | |
| Interest on the same | 20 15 10 | £106,633 15 10 |
| To other creditors | | 7,264 6 7 |
| Making together | | £113,777 19 6 |
| Against which were the following assets—viz.: | | |
| Cash and bills in hand | £3,049 3 6 | |
| Items due to the company | 8,011 10 0 | 11,060 1 3 |
| Which deducted, leaves a balance of debt due by the company, on the 6th of July last, of | | £102,717 18 3 |

As the balance on the 31st December last, according to the report of the directors to the last meeting, was £99,016, the amount paid off in the half-year has been £3,701, leaving pending for the interest upon the debt and charges, amounting to £4,116 10s. 9d.

The balance which was due to Mr. Attwood, amounting to £10,000, was paid off the 1st of April, out of the money received of the New British Iron Company, which had been acquired for that purpose.

The amount received on sales from the 21st December to the 6th July was £6,181, 16s. 6d., and from the 6th July to the present period £1,[illegible]—making together £[illegible] to be resulted to the present year. The amount received since the 6th July has been applied towards the further extinction of the debt, which is now reduced, after deducting credits to about £[illegible], principally notes, amounting to £[illegible], having been paid off, leaving outstanding [illegible]. The amount outstanding on notes is now only £[illegible]. The directors have been enabled to reduce the rate of interest from 5 to 4 per cent. upon those renewed in May last and subsequently.

The directors have the satisfaction of informing the meeting that a considerable amount of the arrears of rent has been received; the amount since the date of last meeting, upon debts payable to the late February last inclusive, being £[illegible].

As regards the remaining defaulters, the directors, in conjunction with the committee, are taking the legal steps authorized by the late Act of Parliament, and actual outlawry are in a forward state, so as to come on for trial at an early period.

The Chairman alluded to the arrears of the defaulters, respecting which he said that every exertion that was right and proper would be made by the directors to enforce those payments, which, indeed, was only their duty to the proprietors at large; and he hoped at some future time to report a considerable further progress in that respect.

Mr. Hughes wished to know the amount due by the defaulters?

The Chairman: £10,000.

Mr. Hughes wished to know what proportion was manufactured good out of that amount?—The Chairman said he could hardly offer an opinion; some, no doubt, were good, others might at the proper time become a matter of compromise, but he was quite of a loss how to offer any decided opinion; he did hope they would all see their obligations, and would fulfil them, knowing that by such an act they were only doing what was just to themselves, as well as to the company.

Mr. Hughes thought the chairman might hold out some prospect; for instance, whether 20 or 40 per cent. could be obtained.—The Chairman: Accounts amounting to £[illegible] have been already received, as mentioned in the report, and it is not improbable that as much more will be received, so, with the £[illegible], may make 20 per cent. upon the amount which was in arrear some time ago.

A Proprietor asked what the debt was now reduced to?—Mr. Brown (the secretary): It has been reduced from upwards of £[illegible], to £[illegible].

A Proprietor asked for information respecting the actions against defaulters for rent?—Mr. Fladgate (the solicitor): There are several actions to be tried at the sittings after term.

A Proprietor wished to know what they had gained by the New Act of Parliament?—Mr. Fladgate said there was a more simple form of declaration, and in some of the forms of proof. The mode of proving all the facts was now merely by their own books.

Mr. H. Taylor stated that he had attended a former meeting, on which occasion he was one of those who had agreed to pay up, and support the directors, upon the assurance of the directors, supported by their legal advisers, that they possessed means to compel those who stood out to pay up their instalments; on this understanding he continued up to a certain period to make his payments, but since then he had found out that those who did so supported the directors only got laughed at by those who stood out; they, as he understood, being now exempted by a clause in the last Act of Parliament. (Hear, hear.) He did not see any of Major Richardson's friends there, who had attended a late meeting.

Mr. Richardson: Perhaps you are sorry you have not some of them with you!

Mr. H. Taylor: I should be happy to have their money with me. (Hear.)

The Chairman said Mr. Taylor was quite in error, in supposing that there was any clause of the nature he had mentioned in the company's Act of Parliament. Perhaps he alluded to the definition of the shares of Major Richardson and a few friends of a year ago, but that was done by the proprietors at large, at a general meeting.

Some warm words here took place between Mr. H. Taylor, Mr. Richardson, the Chairman, Mr. Richardson, and others, as to bygone grievances, but which passed off in a good spirit.

Mr. H. Taylor wished to know why that 1000l. was paid to Mr. Shears?

The hon. proprietor was then about making some sharp animadversions on his conduct, when Mr. Richardson pointed out he thought it was unfair for the hon. proprietor to make such allusions to Mr. Shears, who he was not present to answer for himself. The money alluded to was paid under the resolution of a general meeting ten or twelve years ago. (Hear, hear.)

Mr. H. Taylor said this was the first public company he had ever anything to do with, and it might be a lesson to him for the future.—Mr. Richardson thought it would prove a sharp school to the hon. proprietor.—Mr. H. Taylor: Not a very long school. (Hear, hear.)

The Chairman regretted, in unison with the hon. proprietor, the sale notice of this company, and would have been most happy could any means have been devised to save the hon. proprietor's pocket, or those of his co-partners. He could see of honest intentions, that he did, so far as his means could extend it, some honest to relieve other individuals, by taking on himself the burdens they themselves could not fulfil. (Hear, hear.) He could assure them that no pounds in this world ever gave him so much serious pain and anxiety as the affairs of this company. He was quite ignorant of the early transactions of this company, and only commenced to be actively the director at the board to supply the place of a previous friend. The hon. proprietor (Mr. H. Taylor) had alluded to the connection and quarrelling when opportunity; he might ask, he (the Chairman) was the sole member of the connection that had not quarrelled. This connection did most, and gave their orders to the general trade of proprietors, which was not to be passed out of sight. (Hear, hear.) He could not help alluding to one of the most important proprietors that was ever given to the Court of Exchequer, which was done by Lord Lyndhurst in favour of this company against which, even with a unknown man and unknown position. After that judgment, it was evident to the proprietors, that the shares rose up to the price of 100 per share. (Hear, hear.) From the commencement of the trial, that case was referred to the House of Lords, which was more unfortunate concerned, and was the cause that some of the adventurers of this company; in order to enable them best to cope with that powerful, rich, and, it might such, malicious opposition to the sale trade of the works, or complaints produced every endeavour that was in his power, in conjunction with the council to have Lord Lyndhurst's judgment. He felt bound to say this much on the part of himself and the directors, that they did everything that they thought fit to get the company out of difficulties, and had the matter been continued in the courts, for the creditors. (Hear, hear.) He knew that the hon. proprietor did not mean to impute anything dishonourable to the directors, and was not acquainted with entering the identity towards them, but had only given way to their feeling of disappointment which was natural.

Mr. Taylor had no wish to say a word respecting the integrity of the directors.

Mr. Richardson: Should we be placed in any different position, supposing a call were made to pay off the creditors, in the stage of a non-dividend? Should we have the same power left of enforcing our claims against other proprietors as we have at present?

The Chairman said, it would be doubtful what could be obtained, as it was also what would have to be made up to the other proprietors.

Mr. Richardson thought, that by paying the debts of others, they would further directly against their own interests.—Mr. Richards said, they should look to enforcing the payment of its dues as far as possible.

A Proprietor asked, which sum was deducted from the payment of debts?—The Secretary: The proportions will will shown.

A Proprietor asked how much the call paid up to the 6th July amounted to?—The Chairman: £[illegible] per share.—A Proprietor: Then it was not paid, owing to proprietors either, and a loss to the shares of interest. Was the call either paid or not taken, and to get rid of the interest and expenses?—Mr. Richards: Some time either to relieve the proprietors generally?—The Chairman thought there might be great objections to that at present.

The Chairman said, that as it appeared no proprietor had any further questions to ask, he should propose the adjournment of the meeting.

Mr. Hughes then moved, that the thanks of the meeting be given to the chairman, which was seconded, and passed unanimously.

The meeting then adjourned.

### BRAZILIAN COMPANY.

A general meeting of this company took place at the office, in Broad-street-buildings, City, on Friday, the 23d instant, George Hayward, Esq., in the chair.—The Secretary read the report of the directors.

The report stated, that the operations at Cata Branca, since the last report of the directors, had been stimulated by the extraordinary incidentals to all mining undertakings, as was shown by the following statement of the quantity of tuns stamped, the gold produced, and the average number of tons of tuns to the pennyweight of gold, from 1846 to June 30, 1854, inclusive:—

| | Tuns of tuns stamped. | Lbs. of gold produced. | Tuns of tuns to 1 lb. of gold. |
|---|---|---|---|
| 1846 | 16,220 | 924 | 184 |
| 1847 | 21,704 | 914 | 23 |
| 1848 | 21,013 | 730 | 271 |
| 1849 | 21,640 | 800 | 86 |
| 1850 and 6 months to June 30 | 7,200 | 164 | 44 |

The object so long in view, of extending an increased quantity of tuns, has been fully accomplished—the natural result of the application of a larger force; but the deterioration in the value of the tuns since 1848 had, unfortunately, prevented a corresponding increase in the gold produced. During that year, the tuns having been at the rate of 184 tuns to the 1 lb. of gold, nearly the average of the two preceding years, the gold return was highly satisfactory (924 lbs.), exceeding the current expenditure of the year by about £[illegible]; and the directors entertained well grounded hopes that the patience of the shareholders was on the eve of being rewarded by the long wished for period of the payment of dividends. The tuns following gave a sensible decided increase in the value of the tuns, the average having been 23 tuns to the 1 lb. of gold in 1849, and 271 tuns in 1850; but this evil having been in some measure compensated by the additional quantity stamped, the result was far from encouraging. In 1851 the decline was still more serious, the average having been 86 tuns to the 1 lb. of gold, and the consequent diminution in the profits has caused a very unfavourable change in the position of the company.

Captain Cotsworth was of opinion, that this decline was to be attributed to a slide, which had been found to pass longitudinally through the lode, sloping from east to west, at an angle of about 45°; immediately close to this slide the lode was very much disordered, and the general mass impoverished. This is the usual characteristic of slides; and Captain Cotsworth has always entertained a confirmed expectation, that when the mine should be sunk so low as to be entirely beyond its influence, the lode would again become rich. In order to ascertain this important question, the directors suggested last year to Mr. Edward Harding, the present chief superintendent of the company, that the sinking should be continued till a position could be formed with a new shaft, about 100 fathoms below the bottom, and that the range of the mine should be then fully proved at that depth, by driving both east and west. By the last advices from Cata Branca, this depth had been reached, but the entire construction of the ground could not be completed before the end of the year. Some improvement, though not in any satisfactory extent, has taken place in the lode—the value, which for the first six months of 1850 was 44 tuns to the 1 lb. of gold, having since averaged 41 tuns to the 1 lb.

In May last the directors, after serious deliberation, again wrote to Mr. Harding, calling his attention to the state of the company, and to the absolute necessity of steps being taken to prevent its being further increased. From letters recently received from Mr. Harding, in reply, the directors are hope that the deep workings may be continued—but, supposing them to yield 1 lb. of gold a day, and that the expenses do not exceed that amount, the produce from the other parts of the Cata Branca Mine, which to that from incidentals, may be estimated as profit.

In the event of its becoming necessary to abandon the deep workings, the arches and ground left standing for the purpose of protecting them will be taken down; and the ground being rich, the produce is estimated, at a low estimate, at £[illegible] of gold, or about £[illegible] to value. The other alternatives allowed to by Mr. Harding, of working the Cata Branca lode left only, will be then resorted to; and he expects that the produce from this source and incidentals will be £[illegible] a year, which, with an expenditure reduced to £[illegible] or £[illegible] a year, will still yield a profitable result.

It has not been thought expedient to lay before the meeting a detailed statement of the estimate of the company, which have been examined by the auditors, and may be inspected by the shareholders at the office. The statement appended to the last report was to the 31st December, 1850, at which date, it will be remembered, that a dividend accrued of £[illegible]. The gold produced from that period to the end of 1853 so far exceeded the expenditure as to have admitted, not only of the repayment of this debt, but the of a half per cent. in stock to the amount of about £[illegible]; but, during 1853, the expenditure, although much diminished, has exceeded the produce, and on an estimate of the liabilities and available funds on the 31st December last, there was a deficit of about £[illegible]. The debt of the company at present exceeds that amount—the accumulation of the interest being about £[illegible] beyond the funds in hand. This excess arises partly from payments in anticipation of remittances, and partly from an extraordinary and unprecedented drought, which had prevailed in Brazil for eighteen months, and had so diminished the water power for the stamps, that, as stated by Mr. Harding, there was an accumulation of 1,000 tuns of ore, which could not be stamped till the return of the rainy season.

The directors are happy to state, that since the report was drawn up, letters have been received from Mr. Harding, by which it appears that an improvement had taken place in the lode in sinking.

The captain's reports will be found under "Mining Correspondence."

The Chairman regretted the directors could not supply any further information to the proprietors. He was sorry for the absence of Capt. Cotsworth, who was ill in bed, so he could confirm the statements in the report by his own opinion and experience.—Mr. Gray said the directors had advanced money, and now increased their responsibilities more, once.—The Chairman: Not the total is about 1000l. in the present time.

Mr. Gray wished to know the estimated value of the property in the Brazils?—Mr. Cotsworth (a director) said that was a difficult question to answer beyond this, that if they were to be dissolved, there would be enough to pay off their debts, and have a large surplus.—Mr. Wray thought there was an appearance of the mine looking better than at any former time.—Mr. Cotsworth said the directors thought so, and wished to prove if the mine was of any good or not; but, in the mean time, they did not call upon the shareholders, but came forward themselves. (Hear, hear.)

The report being been adopted, Mr. Gray alluded to the handsome way in which the directors had come forward to second the examination they thought expedient, by incurring great responsibilities, and to the number of years they had given their best attention to the company without remuneration. He hoped the appearance of the mine was an indication of much prosperous results to the proprietors, and that the next time they met, it would be under more favourable auspices, so as to be gratified with the sight of a dividend. He begged to move a vote of thanks to the directors.—Mr. Wray seconded the motion, which was passed unanimously.—The meeting then adjourned.

Dublin Lahey and Fingal Cabl Railway.—A meeting of the shareholders was held yesterday week, at which Mr. Bradley read a statement of the present condition of the company, showing £[illegible] 10s. profit on the half year. The Rev. Mr. Knight made some remarks as to the state of the line, which, however, was satisfactorily answered by Sir R. Peel, who said that some had been already laid out in improvements, and the directors were in hearty to borrow 50000l. more for the same purpose—the probable expense of re-laying the road, and fitting it for the introduction of locomotives, is about 20000l.—A dividend of 3½ per cent. was declared.—From the present prospects of the company, the directors anticipate that they will ere long be enabled to introduce steam and materially improve the line, at the same time returning a profit to the shareholders.—A correspondent, in noticing this meeting, says:—"The proceedings certainly gave very good satisfaction to the shareholders; and the dividend declared was paid at the time to the same hire present, and will be in every shareholder in a few days. There was some discussion relative to the state of the road—the keep it in repair generally to its present plan, was agreed on all hands would be wholly inadequate to the increased, and still increasing, traffic; and it was finally recommended to the committee to adopt such measures as would effectually put an end to all complaints, by re-laying it, so as to carry locomotive engines, and thus have the benefit of the company's own hands. Two years ago, the company were largely in debt, had no money in their bankers' hands, and chances were not to gloomy, anxious the evil, such, which cost 1000—now, they are nothing, have a large balance, and 10l. per share was offered and refused at the last meeting. All the difficulties which so long stood in the way of the government have happily been overcome and removed; there is now no personal reality to be guarded, no opposition can to be displayed, no obstacle projected to be encountered, so that the shareholders may confidently look forward to the receipt of their half-year's 5l. per cent. coming, as at every distant period."

New South Wales.—M. Dumoulin has thought of substituting hydrochloric ether for water. At the last meeting of the Academy of Sciences, M. Pouillet stated that a machine of M. Dumoulin's on this system, in which the heat was from a high pressure steam engine of a horse power was used, gave of itself an available power of four horses. We trust the report of the Academy on this subject will not be long before it is forthcoming.—Mechanics' Magazine.

Steam Mines of Pontesford Wood.—It is not so generally known as it ought to be that powerful alum possesses the property of purifying water. A table spoonful of pulverized alum sprinkled into a hogshead of water (the water stirred at the time) will, after the lapse of a few hours, by precipitating to the bottom the impure particles, so purify it that it will be found to possess nearly all the freshness and clearness of the finest spring water. A pailful, containing four gallons, may be purified by a single tea spoonful.

Phosphorescence of Linen.—M. Arago states that the state of polarization generated by the light given out to proceeds from the interior of a solid body; as indicated you, on the contrary, gives an kind of reflection. There is may be conceived, that the luminous position of the sun is a gas. The light given out by a solid body comes partly from the interior, and in part the same which illuminates it.

## MINING CORRESPONDENCE.

### ENGLISH MINES.

BOLENTHUM MINING COMPANY.

Nov. 18.—In the sump winze sinking below the 110 fathom level, and in the same level west of Hitchins's shaft, the ground continues favourable; in the stopes in the back of this level, east and west of Michell's winze, the lode is eighteen inches wide, and worth 22l. per fathom; in the stopes west of Goldsworthy's winze the lode is one foot wide, and worth 12l. per fathom; in the stopes west of Lobb's winze the lode is sixteen inches wide, and worth 25l. per fathom; in the south lode stopes, east and west of Goldsworthy's winze, the lode is fourteen inches wide, and worth 20l. per fathom. In the 100 fathom level, west of Hitchins's shaft, the lode is twenty inches wide, and worth 40l. per fathom; at this level, east of the south cross-cut, we have cut the cross course, the lode up to this point has been equally good as when last reported, worth 36l. per fathom; in the eastern stopes in the back of this level the lode is one foot wide, and worth 9l. per fathom; in the stopes west of Hitchins's shaft the lode is fourteen inches wide, and worth 12l. per fathom; in the stopes east of Forest's winze the lode is ten inches wide, and worth 9l. per fathom; at this level east of Wall's shaft the lode is small and poor. In the ninety fathom level, west of Hitchins's shaft, the lode is still in a disordered state; in the stopes west of Pearce's winze the lode is fifteen inches wide, and worth 16l. per fathom; in the stopes west of the end at Hitchins's shaft the lode is fifteen inches wide, and worth 16l. per fathom. In the eighty fathom level, west of Hitchins's shaft, the lode is fourteen inches wide, and worth 12l. per fathom; the lode in the rise in the back of this level is also inches wide, producing stones of ore. In the sixty-two fathom level, west of the great cross-course, the lode is ten inches wide, and worth 5l. per fathom. The pitches are without important alteration.

J. Richards.

GREAT WHEAL MARTHA CONSOLIDATED MINES.

Nov. 16.—The engine-shaft is sunk nine feet below the seventy fathom level; in the adventure level going west the lode is six feet wide, composed of capel and moodie. In the sixty fathom level west the lode is six feet wide, composed of spar, moodie, and capel, impregnated with ore. The cross-course at the forty west is driven nine and a half fathoms.—At the new mine, Thomas's shaft is now sunk ten fathoms below the ten fathom level. The lode in the ten fathom level east is still three feet wide, composed of capel, moodie, and copper. The deep adit is now driven thirty-four fathoms.—We have commenced dressing another parcel of ore.

T. Penaluna.

COOK'S KITCHEN MINE.

Nov. 16.—In the stopes in the bottom of the sixty fathom level, east of the shaft, on North Tincroft lode, the lode is four feet wide, worth 12l. per fm.; dilto west of the shaft, lode four feet wide, worth 20l. per fathom; in the cross-cut, driving south from the sixty fathom level to cut the south lode, the ground is still rather hard; in the pitch in the back of this level (at 9s. in the 1l.) the men are getting good wages. We have not been able to do much in sinking the flat rod shaft this week, in consequence of a breakage in the wheel which draws from the said shaft; we expect it will take the greater of next week to put it in repair. The new rest shaft, sinking under the eighty-two fathom level, is down about ten fathoms under the said level, ground rather hard; the lode in the winze in the bottom of this level is still disordered by the cross course; the pitch in the back of the eighty-two fathom level on this lode is still looking favourable. We are driving the cross-cut at the seventy-two level, to cut middle engine lode, ground favourable. Chapple's lode in the 120 fathom level has much the same appearance as last week, worth about 7l. per fathom for tin. We have not yet cut the lode in the cross-cut driving south at the 111 fathom level. The ninety-two cross-cut, driving south to cut Enoby's lode, is still progressing, ground rather hard. Dunkin's lode in the 120 fathom level is three feet wide, producing stones of tin. In the 100 west the lode is three feet wide, worth 6l. per fm. for tin. In the cross-cut at the twenty-nine south from E gen's shaft the ground is still hard. The lode in the shaft sinking on the counter is four feet wide, producing good work for tin. Since our last we have not been sinking the shaft on the Druid lode, having been timbering and securing it. Our tin pitches still continue to look well, and we find our supply of water daily increasing, which will soon enable us to make larger returns of black tin.

A. Kurdy.

WEST WHEAL JEWEL MINING ASSOCIATION.

Nov. 16.—In the 100 fathom level, east on Wheal Jewel, the lode is one foot wide, unproductive. In the eighty-five fathom level, east on ditto, the lode is worth 12l. per fathom; in the same level, west on ditto, the lode is still in disordered ground. In the winze sinking below the seventy, west on ditto, the lode is worth 10l. per fathom; in the winze sinking below the seventy, east on ditto, the lode is worth 13l. per fathom. In the fifty-seven fathom level, east on Buckingham's, the lode is worth 8l. per fathom. In the thirty fathom level, east on Morcom's, the lode is three feet wide, still very promising for ore. At Wilkinson's engine-shaft, sinking below the fifteen fathom level, the lode is two and a half feet wide, with a small leader of ore on the north wall. All other places are without alteration.

S. Lean. R. Jenne.

CALLINGTON MINING COMPANY.

Nov. 18.—The north engine-shaft is sunk three fathoms below the eighty fathom level; at this level driving south the lode continues to yield work of rich quality; the tucks we are tearing will pay 4s. to the 1l. on the value of the lead. The lode in the seventy has improved to the past week, the tucks will pay 6s. to the 1l. The sixty, fifty, and winze below the forty, are opening of tributo ground. The copper lode at the seventy is improving in size, and has a very promising appearance, producing good stones of copper ore; there is also a feeling branch approaching the lode. Johnson's engine-shaft men are now fixing a lift at the sixty fathom level; at this level driving south the lode is disordered for the present by hard branches of capel; in the north end we are opening tributo ground. In the eighty fathom level north we have still a rich lode, tearing tucks that will pay at a low figure; in the south end we are driving through ground that will work at a moderate tributo; the same may be said of the sixty, and also of the winze sinking below the seventy.

J. T. Passaro.

CARGUVIAN MINING COMPANY.

Nov. 16.—I have again gone through these mines to-day, underground, with the agents, and beg to hand you the following as my report:—Murray's engine-shaft is in very diagonal ground, and the Chiverton lode there is from eighteen inches to two feet wide, yielding rich stones of lead; we have and now this shaft looking so promising for many fathoms sinking. At the seventy eight fathom level, driving west of Murray's engine-shaft, Chiverton lode is two feet wide, but at present unproductive; at this level, going south-east on the counter lode, the lode is now two feet wide, worth about 1 ton of lead per fathom; in driving on this lode north-west, it has come in contact with the Chiverton lode, and on for the counter accompanies it, showing no separation in that direction—being now satisfied on this point, we have removed the men from that place to rise a winze on the said counter lode from the back of the seventy eight fathom level, which will throw a greater light on this new branch presented lately. At the seventy fathom level, some of the pitches on the north lode look well, and are improved since setting day. At Crantonglass, the lode at the eighteen fathom level is promising going east, and producing some lead; we have set a pitch there in the back of the level, at 3l. 15s. per ton. The shaft sinking below the eighteen fathom level is progressing rather slowly, owing to the increase of water from the almost unknown vein.

E. Rowe.

TREGONGO CONSOLS MINING COMPANY.

Nov. 16.—In the stoop winze below the eighty the lode is two and a half feet wide, not broken the west, but looks well. In the seventy east of Grand Fortune the lode is three and a half feet wide, rather kindly, with stones of ore; in the seventy west of ditto the lode is three feet wide, producing stones of ore. In the sixty west of ditto the lode is two and a quarter feet wide, worth 12l. per fathom, with a very kindly appearance. In the winze below the fifty east the lode is one foot wide, worth 7l. per fathom; in the winze below the fifty west the lode is two and a half feet wide, worth 8l. per fm. In the fifty west of Sparnon's the lode is eighteen inches wide, worth 8l. per fathom. In the forty four west of ditto the lode is twenty inches wide, worth 7l. per fathom. In the thirty-five west of ditto the lode is two feet wide, producing stones of ore. In the winze below the twenty west the lode is four feet wide, kindly, with stones of ore; in the adit west of ditto the lode is one foot wide, poor. At Gooch's shaft at the seventy, we are driving the shaft, and putting in posts-timber, with other necessary work, for sinking below this level; we hope to commence sinking the latter part of next week.

T. Symons.

TRURO WHEAL MINERS COMPANY.

Nov. 18.—In the eighty fathom level cannon out the lode is four and a half feet wide, two feet in the north part are of good quality; in the western end the lode is three feet wide, very throughout, hot and rich. In the seventy fathom level the lode in the western end is three feet wide, eighteen inches are of average quality; in the western end the lode is four and a half feet wide, very throughout, of a superior quality; the lode in the stopes in these feet wide, fifteen inches good ore. In the eighty fathom level, east on western shaft, the lode is three feet wide, eighteen inches are of a average quality; west of Dennis's shaft the lode is four feet wide, producing not a small quantity of ore; in the winze the lode is three and a half feet wide, two feet are of good quality; nothing done in the stopes east for the past week, in consequence of the water being in. In the fifty fathom level the ground is favourable for driving, nothing happened since last week. In the thirty fathom level we are working on the past week. In the ten fathom level the lode is three feet wide, producing some good stones of ore, with a promising appearance.—At Wheal Squarose, on the fifty fathom level, by driving the cross-cut south, we have cut the lode, it is three feet wide, producing some good stones of ore, looking much better than it did in the forty cross-cut above. In the forty fathom level

eastern end the lode is twenty inches wide, ten inches ore of good quality; in the western end the lode is eighteen inches wide, one foot ore of average quality. In the thirty fathom level, no lode broken in this end for the past week. In the twenty fathom level no alteration for the past week. In the ten fathom level, on Stacey's lode driving west, the lode is eighteen inches wide, producing but a small quantity of ore; we have not cut the lode as yet in this cross-cut. N. LANGDON. T. TREVENEN.

CONSOLIDATED TREVOIL MINING COMPANY.

*Nov.* 18.—The lode in Henwood's shaft, sinking under the sixty fathom level, is twenty inches wide, worth 7*l.* per fathom, price for sinking 7*l.* 10*s.* per fathom; the lode in the sixty fathom level, west of Henwood's shaft, is fourteen inches wide, worth 3*l.* per fathom, price for driving 2*l.* 15*s.* per fathom, tribute (when set) 10*s.* in the 1*l.*; the lode in the sixty fathom level, east of Henwood's shaft, is fourteen inches wide, worth 3*l.* per fathom, price for driving 2*l.* per fathom, tribute (when set) 10*s.* in the 1*l.*; the lode in the rise in the back of this level, east of Henwood's shaft, is twenty inches wide, and worth 4*l.* per fathom, price for rising 2*l.* per fathom. The lode in the fifty fathom level, east of Henwood's shaft, is one foot wide, producing some good ore, price for driving 2*l.* 5*s.* per fathom. The lode in the forty fathom level, east of Henwood's shaft, is fourteen inches wide, worth 4*l.* per fathom, price for driving 2*l.* 15*s.* per fathom, tribute (when set) 7*s.* 6*d.* in the 1*l.* We have sampled this day 100 tons of ore. H. WILLIAMS. J. MORCOM.

BEDFORD UNITED MINING COMPANY.

*Nov.* 19.—At Wheal Marquis, the fifty-eight fm. level east has been holed to the sump winze, and the lode is about two and a half feet wide, composed of gossan, spar, and ore, worth 12*l.* per fathom; at this level west the lode is two feet wide, and worth 15*l.* per fm. The lode in the forty seven fathom level west still continues productive, being twenty inches wide, and worth 16*l.* per fathom; no lode has been taken down in the winze in the bottom of this level since last report; in the rise in the back of this level the lode is two feet wide, and worth 20*l.* per fathom. In the winze sinking in the bottom of the thirty five fathom level west the lode is two feet wide, and worth 20*l.* per fathom. The lode in the deep adit level is without alteration. The pitches are looking well.—At Ding Dong, the lode in the twelve fathom level east is two feet wide, composed of spar, mundic, and ore, saving work, and very promising; in the back of this level, about six fathoms west of the present end, a pitch has been set, in which the lode has proved very productive, being about three feet wide, and worth 25*l.* per fathom.—At Wheal Tavistock, we are busily engaged putting in machinery, as last advised. Our Friday work's sampling will be 110 tons of real good quality ore. On the whole, I am happy to say that our prospects are very encouraging. J. PHILLIPS.

STRAY PARK AND CAMBORNE VEAN MINES.

*Nov.* 18.—In the sixty-five fathom level cross-cut, driving north in Wheal Goon, the ground is favourable, and set at 5*l.* per fathom. In the ninety end, driving west on the south lode, there is a good course of ore, yielding 3 tons to a fathom, which has made its appearance within the last six feet driving; this end is going in over the 100, and within seven fathoms of the present end. In the 105 fathom level driving west, during the last month, we have driven about three fathoms on a course of yellow ore between five and six feet wide, which has yielded from 12 tons to 15 tons per fathom, and at the present time it is fully as good in back, bottom, and end, with every appearance of making a lasting course of ore; the lode which fell in from the north series declining in going east, and we think it probable that it will again slip out into our main level; at the commencement of the course of ore in this (105 fathom) level we are now sinking a winze, and we find the lode continuing both its size and quality in going down. We shall sample, on Wednesday next, upwards of 30 tons of ore from this new discovery, which has been broken in little more than three fathoms of ground. The 110 fathom level we have resumed driving west, and which is within fourteen fathoms of the 100 end—the lode at present is small. The 120 west is within nine fathoms of the 100 end—the lode during the past month in this western end has averaged about eighteen inches wide, but not rich; in the 120 east the lode throughout the past month has yielded 4 tons of ore to a fathom. The 140 fathom level, driving east, is still unproductive. In the cross-cut at the 130 fathom level we have intersected the south lode, and find it to be a strong lode, between two and three feet wide, composed of spar and yellow ore; we have commenced driving on it both east and west, and we hope in our next report to be able to speak of it in an improved style. In the 100 we have communicated with the level above, and thereby let down the water from the bottom of the 170, and afforded free ventilation to this part of the mine; we have commenced driving a cross cut south at the 100, to intersect our south lode, which object we hope to accomplish in about three months from this time. The mine is just getting into good working order, with a fair prospect of remunerating the adventurers. R. RUTTEN. E. SALES.

## FOREIGN MINES.

ST. JOHN DEL REY MINING COMPANY.

*Morro Velho, Sept.* 8.—Produce for August, 11,418 ozts.=110·762 lbs. troy, from 3049 tons of ore=4·426 ozts. per ton; 112 tons of previously rejected ores were stamped, but, on the other hand, a large quantity of West Cathorios ores were rejected. I consider the produce a very good one; and you will be pleased to learn, that the West Cathorios has yielded for the month 3·967 ozts. per ton (say 4 ozts.), which is an improvement of some 50 per cent. on the previous yielding.

*Mine Report.*—In this report there is nothing particular to remark on. A new whim is now hoisting from the West Cathorios, and the clearing out of adits from the western part of this working still continues. The Harden lead is now nearly completely repaired, and will be an excellent lead.

Cost for August, Rs. 71,024 $=£8[illegible], or, at 2*s.*=£[illegible]. 12*s.* There are two heavy items in this cost—Buyer iron, Rs. 929 $=£92, and Ferjazes (Bean's), Rs. 2180; but there is nothing to find fault with, considering the spirit with which the works are being pushed. C. HERRING, Jun.

Received, per packet, 160lbs. 0oz. 0dwts. troy of gold.

IMPERIAL BRAZILIAN MINING ASSOCIATION.

*Gongo Soco, Sept.* 13.—On the 10th and 11th inst. we were gratified by the discovery of a bunch of gold within about five or six fathoms of the surface, west of Pengilly's shaft, considerably to the west of anything equally valuable discovered in our previous workings; it has yielded for the working-house 16 lbs. 1 oz. 10 dwts., but to day it has been unproductive; we are, however, not without hope that we may yet see more of it—and although, compared with your former riches, the quantity is not great, yet, being in ground not very thoroughly worked, it has greatly raised our spirits. The other parts of the mine call for but little remark. We have commenced two exploratory cross-cuts in the eastern part of the estate, the most easterly not far from that which I recommended and commenced some months since. The stamps produce is slightly improved, and, as the rains have commenced, we hope will be still better during the ensuing ten days. Cata Preta presents nothing new, and, as our present works are exploratory, we scarcely expect much from them until further advanced. W. J. HENWOOD.

BRAZILIAN COMPANY.

*Cata Branca, August* 28.—The inclosed weekly gold report, I am happy to say, bears out the hope expressed in my last of an improvement in the bottoms, where the appearance of the ground, particularly on the south wall side, and close to the pump, has so much changed for the better, that, without being at all sanguine that such will be the case, I trust we may yet fairly look forward to better times than of late. I anxiously await the next few weeks' stamping to prove this, or otherwise. The pounding may opinion experience has shown to be of little value, and the gold reports must speak for themselves. The rainy season appears likely to set in early this year. A few refreshing showers have already fallen, and I hope soon to see an increased gold return from the more efficient stamping at Cata Branca, and fairly working the two 5-head stamps at Sumidouro.

*August* 30.—In the mine I have no alteration to notice. The gold report for this week will out, I fear, cause 6 lbs. to 7 lbs., but this does not arise from any falling off in the value of the stone from the bottoms, but from the fact of the bottoms having been partially under water for two days, and the stamps having been there supplied from No. 6 stopes, the lode from which is as bad as it can be. At the same time, this ground must be worked, for, if it is found that the bottoms continue to improve, we may fairly assume that the eastern ground, sooner or later, will do as likewise.

*Sept.* 4.—I trust the stamping of this week will fully bear out the improvement which I have mentioned in the lode below. I look to 9 lbs. or 10 lbs. of gold from 100 tons of ore, and that mined ore, some portion being from No. 6 stopes, where the ground continues unusually good.

*Sept.* 5.—The inclosed gold report, though not as good as I hoped it would be, still shows an falling off in the lode below. The only reason that the produce did not reach 9 lbs. to 10 lbs. was, that, towards the latter part of the week, we were again obliged to fall back upon the eastern ground, or No. 6 stopes, to which there is no improvement. The western stopes are, if anything, better, and I think that the present week's gold report will prove that they are so. We are still doing working at Sumidouro, from the want of water; this is provoking, for a week of sunny is there broken, and there is every facility for breaking more.

*Sept.* 12.—I am happy to inform you that the improvement lately noticed continues. You will see, by a reference to the inclosed gold report, that the average of the lode stamped in the past week is about forty lbs. to the pound, and, when it is remembered that only 100 tons of western and shaft ground were operated, the latter of which is still poor, and that the remainder was from the eastern ground, or No. 6 stopes, which continues very bad, the great change for the better mentioned in the above weekend. I look on this week's stamping with anxiety, as I hope to keep the stamps-mill supplied from the western and shaft ground. I also expect to do better at Sumidouro, as the sets of stamps are to-day, for the first time, doing something like duty, but the rain which has hitherto fallen has not been sufficient to have a beneficial effect on the springs. E. HARDING.

Gold return for four weeks to 12th Sept.—34 lbs. 0 oz. 10 dwts. 16 grs.

ALTON MINING ASSOCIATION.

*Alton Copper-Works, Sept.* 28.—The short time elapsed since my return to the works has not been sufficient to fully investigate and make myself acquainted with all the works carried on, and discoveries made, during my absence; consequently, I am prevented from entering so fully into detail on the prospects of the different mines as I could wish. The following remarks are made only from a cursory inspection of some of the lodes; but I hope in my next to lay before you a report founded on a more minute investigation.

*Reipas.*—The workings on this mine have been much extended, particularly to the northward, where several promising lodes have been met with. Judging from the kindly appearance of the lodes, consisting of gossan and small patches of rich black oxides and sulphurets of copper, together with the green and blue carbonates disseminated throughout the same, and the rich appearance of several of the new places to the north of the ten fathom level, as well as in the vicinity of shaft No. 1, I can confidently state, that greater reasons for expecting a permanent supply of ore from this mine have never been presented, neither have I seen the prospects, on the whole, so flattering for many years.

*United Mines.*—The stopes in the eighty fathom level (the only operations at present conducted on this branch of the concern) are all very poor. None of the present workings can by any means pay the costs; and next month it will be necessary to make an alteration, for the security of the mine and lives of the workmen, as well as for exploring the lodes in depth, at less expense and more expeditiously than at present. The lode in the bottom of the shaft still continues to dip northerly, and directly under the workings in the eighty; it contains some good ore, disseminated throughout with calcareous spar and quartz, of which it is principally composed. Some new workings will be necessary for laying open the lode in this part of the mine; and, after making myself acquainted with the run and dip of the lode, and its general appearance under the eighty, they will be determined on, and made known to you for approval. The ore from this mine, as denoted by the delivery notes, is of very inferior quality, and will undoubtedly prove more advantageous to the establishment if returned in smaller quantities to the smelting-house, after being dressed to a higher per centage.

*Ripper's.*—This mine continues equally promising; the lodes are large and regular, and at the different points of intersection (which cannot be far distant) we have every reason to expect the same improvement that has invariably taken place on other branches of this establishment, where a number of lodes and veins have been found intersecting each other.

*Quantity.*—The lodes here, although numerous, from being so small, cannot return any large quantity of ore, and particularly since the falling in of the old excavations has prevented the further prosecution of the workings; a part of the rubbish is now being removed, and it is proposed to drive a level on the course of the lode when it is again opened, and we hope shortly to regain the very part of the vein. The more recent discoveries are so new to me, and the lodes so totally different from those I have hitherto been accustomed to, that you will excuse me for not entering so fully into detail on their prospects, and for not giving my opinion thereon, before I have become acquainted with their several situations, run, and bearings with regard to each other, the nature of the rock containing them, and the mineralogical and geological character of that part of your mining district in which they are situated.

*Wilson's.*—The two bargains working on the new lode have become very poor; in the ensuing month it is proposed to place four of the men to explore Wilson's old workings, whilst the other four will be employed in the sick on this lode, to determine, if possible, the dip of the ore in depth.

In the dressing department, the stamps only have latterly been at work, and preparations are now making for closing these operations before the winter sets in; in the early part of next week the whole stock of stamped ores will be returned to the smelting-house. In my next, I hope to be prepared to lay before you a description of the workings necessary for the further prosecution of the mines, and the prospects presented by the same, for your approbation. S. H. THOMAS.

COPIAPO MINING COMPANY.

*Copiapo, June* 30.—In presenting the report of the prospects, operations, and produce of the company's mines for May, I beg to observe, that at the San Jorge silver mine we have in the bottom, or deepest part, a lode more than five feet wide, nearly the whole of which contains a small quantity of silver, and has to much of a metallic appearance, that it has been judged by some, who have had considerable experience in silver mines, to be ore of good quality; and we fully believe that the day is not far distant when this lode will be found productive of good ore, and in large quantities. In the ten fathom level we have had a pretty little vein of silver ore, from which we extracted in May forty-five quintals, and it still looks very encouraging, with silver perceptible. The other lode, so far as we have opened it, has a cheering appearance, and I hesitate not to say that the mine altogether has never shown at any time so many pleasing indications as at the present. At the Chico copper mine, where in the west end there was a beautiful lode of ore about the middle of May, it was soon after unexpectedly cut out, by coming in contact with the "lock" of a cross-course, that heaved or dislocated the lode, and threw it out of its course two fathoms; here we were occupied a fortnight in its pursuit before we found it, which considerably affected our produce for May; but I am happy to inform you that we have found the lode again, and nearly as productive of good ore as before it encountered the heave. In the east end our prospects are nearly the same as when last reported on, and with our present force, being four additional hands, unless some unforeseen disappointment intrude itself in our way, the produce will in future be increased. I have many times in Chico seen good bunches of rich ore from two to three feet wide, which in less than two feet advance have entirely disappeared, leaving the end without a single spot; and, on the other hand, we sometimes rather unexpectedly meet with good bunches; this is more or less experienced in most mines, but I never yet saw a mine where it so frequently occurs as in Chico. The lode in the bottom of Pampa Longa silver mine, where we are still sinking, is full three feet wide, and nearly free from the conglomerate produced by the junction. It has still a little arsenic mixed with quartz, but which continues to decrease as we proceed in depth, and will, I think, shortly entirely disappear; the lode is much harder than in the levels above, consequently we cannot make that progress we otherwise should. The long level east in mine barrier, and the lode large, with an appearance equally flattering to what it has ever been. The lode in the winze, sinking below this level, is precisely the same as when last reported on. We are sinking and driving on the lode near the Estrella Del Rey, which in each of the workings is full two feet wide, producing ore throughout; on this lode that quality ore is abundant; all the other parts remain without alteration. At San Pedro copper mine our prospects are exceedingly cheering, although as yet the produce is not great, but when you take into consideration the short time since we commenced operations there, and what we have accomplished in that time, have sunk a new shaft, unwatered the mine, and cleared out hundreds of tons of rubbish, with still a great deal more to do, in order to bring the mine into a good state of working. All these things being considered, that have been carrying on in the mine time, I do not think the produce bad; however, I have no fear we shall go on increasing here. In driving the twelve fathom level south the lode has been poor for the last five fathoms, until about fifteen days since, when we discovered in the bottom of the level a good lode, eighteen inches wide, and have passed on through it, or rather over it, four fathoms in length; the ore does not come up above a foot to the level, which leads me to believe it is the top of a new shaft, or bunch of ore, to prove which, we shall as soon as possible commence the sinking of a winze down through the best part, as far as we can judge from appearance in the bottom of the level; and if this ore cut as it promises, it will give still a brighter and more cheering feature to the concern. The new counter lode varies in width from one end a half to two feet, about five inches of which is ore of good quality; I fully believe that this will improve in depth, especially as we approach it, or come into contact with, another vein that we have only a few fathoms distant, and which is running parallel with the main lode. This new parallel lode we found at the surface, in climbing over and carefully examining the hills, when in Paquisa in May; we have been working on it now about three weeks, in which time two of our English miners have taken out about two tons of ore, that I am confident will produce 40 per cent. of copper; those three stones which I gave you from this lode are about an average quality of the ore estimated; this, say a few cases below the surface, is, in my opinion, presenting the most encouraging prospects. In the Goedrewin copper mine we have been digging all the little value of good ore in the shallow or upper parts of the mine, and in the last month succeeded in raising rather more than I expected, by cutting into a large gossan lode, that had been by the old workers left to stand only four or five fathoms below the surface. No other improvement whatever has taken place. The produce in fine Pedra for May, 30 tons; Chico, 22 tons; Goedrewin, 20 tons—total, 72 tons.

[The *Margaret Hardy* has arrived at Swansea, with 400 tons of copper ore for this company.]

## MINE ACCIDENTS.

*Engle's Bank Colliery.*—A large stone fell on the head of a miner, named Bennett, and literally crushed him.

*Cambrepond.*—Two fatal accidents have occurred here—one to R. Anthony, from an explosion of fire damp; the other to J. Jones, who was killed by a fall of coltstaff.

*Pendeulin, near Wigan.*—An engine of water and foul air succeeded in Mrs. Wilcinson's colliery, by which R. Fairhurst and W. Farnham were killed, and eight others more or less injured. We believe the chief cause of the accident to have been, the ignition of the foul air by lights which were being used by a party of men, who accidently passed over the spot at the time.

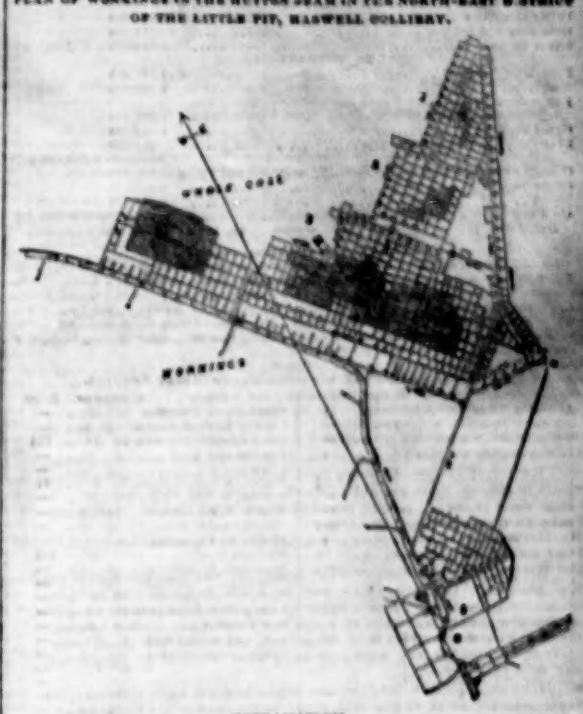
*Bickley Colliery, near Mondsley.*—Three brothers, named Laird, and a companion, were fearfully scalded from carelessness on the part of the engine man, in allowing the cage to be drawn up to the bars.

*Shrewsbury.*—A little boy, the son of a fireman working at one of the Rhymney furnaces, was playing about the coke, his foot slipped, and he fell into the furnace; his father, who was standing by, immediately sprang in after him, hoping to save child—but he was too late. The father then had to extricate himself from his dreadful position, which he was enabled to do by catching hold of an iron bar, little less than red hot, and swinging himself out; but as soon as he had done so, he was senseless; he was carried home, and now lies in a dangerous and uncertain state.

## EXPLOSION AT HASWELL COLLIERY.

Having received several communications requesting that we would obtain a plan of the workings, we now present to our readers a diagram, showing the workings in the Hutton seam, in the north-east district of the "Little Pit," at Haswell Colliery. Some remarks from a correspondent, who possesses much local and practical knowledge, will, we have reason to hope, appear in our next or an early Number.

PLAN OF WORKINGS IN THE HUTTON SEAM IN THE NORTH-EAST DISTRICT OF THE LITTLE PIT, HASWELL COLLIERY.



EXPLANATION.

1. Low Brockley Whins Way.
2. High Brockley Whins Way.
3. Meadows Way.
4. Furnaces.
5. Little Pit.
6. Engine Pit.
7. Engine plane to the East Workings.

## MINING IN THE EASTERN DISTRICT OF CORNWALL.

[FROM A CORRESPONDENT.]

The lodes in this part of the county have within the last few years attracted considerable attention by the productiveness of those valuable mines, South and West Caradon, which has been followed by the taking up all the ground for mining purposes within several miles of the locality of Caradon Hill. Perseverance is the characteristic of the mining capitalist, for he is not deterred by the misfortunes of others from recommencing adventures that have been abandoned by former parties, and, consequently, workings have been renewed upon old mines, with every probability of becoming lasting concerns. Wheal Gill, in the parish of St. Ives, a few miles south of the Caradon, has recently recommenced, and an excellent lode of copper ore has been discovered in the ten fathom level, which is in course of driving, whilst the water-wheels are about to be displaced for the more efficient power of the steam-engine, in consequence of the deficiency of surface water. The copper of Holmbush and the silver lead of the Collington Mines have induced the opening of North Holmbush and the Great Wheal Martin lodes, with indications of much promise. Still going east, the Old Gonamena Lake and Hawkmoor lodes are developing the anticipated wealth, beneath the beautiful greens, to gratifying to the practical eye of the enterprising Cornish miner; whilst on the borders of Devon, the Marquis lodes in Bedford Consols have placed this mine above a speculation. Adjoining this set on the north, a most valuable discovery in Wheal Martin has just been effected, under the superintendence of Mr. J. H. Hitchens; the shaft has been sunk to the depth of sixteen fathoms, and a course of *solid copper ore* of eighteen inches wide (stated to be worth 30*l.* per ton) has been laid open. In the parish of Calstock, workings on the silver and copper lodes of Harewbarrow Consols are being resumed, whilst Harewbarrow set is in course of being purchased for immediate working; here, in a short time, the united efforts of the engineer and miner will be engaged in developing the riches of this district—and, whilst the Great Caradon holds up his bold head with conscious pride of innate wealth, Kit Hill still not be long here be contesting the palm. This is, most decidedly, a great mining district.—*Devonport*, Nov. 20. Z. E. D.

[We are not apt to offer any comment on "Z. E. D.'s" communications; but a course of solid copper ore, eighteen inches big, worth 30*l.* per ton, is somewhat marvellous. What does our correspondent consider the lode worth per fathom for driving?]

MINING IN TAVISTOCK.—*(From a Correspondent.)*—Considerable work has been done at Wheal Gonaps and Charlotte, on the banks of the Tamar, Tavistock—the shaft having been sunk, and levels driven, by the late adventurers. On re-opening the mine, some good ore was discovered in the several levels, in which three pitches have been working, and a bargain set to drive into the hill beyond the cross-course, so as to unwater the lode in the shallower levels—there being a constant supply of water to any required extent, for working machinery, dressing the ore, &c.

WHEAL ANDREW.—*(From a Correspondent.)*—This mine, which has been looked upon with so much doubt, from the report that all the ore raised was preserved in a barrow (not a barrow), is likely to prove itself fully deserving the unwearied attention and energy observed by the managers, Captain Carpenter—three pitches having been set at 3*s.* in the 1*l.*—A SUBSCRIBER, AND NO "ABSTRACT."

LEAD ORE.—A gentleman, a native of this city, newly arrived from Australia, has handed to us a specimen of the lead ore (galena) found in that colony. We find, in a paper accompanying the ore, the following report of an analysis, made by a scientific gentleman, of the various components of the ore:—Silver, 19; lead, 40; sulphur, 19; siliceous, &c., 20.—Total, 100.—*Aberdeen Herald.*—[Ten per cent. of silver is a large produce, and the ore would realise some under the determination of a silver lode than for lead produce, as 40 per cent. would not pay of itself; if the assay be from a fair average sample, the value of the ore would be 60*l.* per ton.]

COAL IN TURKEY.—A letter, dated Constantinople, Oct. 20, says—"The coal mines of Eregli, having now been properly worked, are said to yield fuel equal to English coal; it will yet be some time, however, before we can do without the latter."

MONKWEARMOUTH COLLIERY.—The workmen belonging to Middleton Colliery and their wives, to the number of 600, have been entertained at dinner and tea by Mr. Brandling, the proprietor of those works, to mark his appreciation of their good conduct during a series of years past, and more particularly of their behaviour during the late strike. The speeches which were delivered reflected a degree of good feeling highly creditable both to masters and men.

THE ACCIDENT AT BLACKWATER.—The inquest on the sufferers by the explosion on board the *Gipsy Queen* (full particulars of which we gave last week) commenced on Saturday, when the jury returned a verdict of "accidental death," adding—"That the death of Jacob Gwards and the other deceased persons was caused by the bursting of the main steam pipe, and that their bursting was occasioned by the false and improper construction of the joints of those pipes in not being sufficiently secured; and they express their opinion, in order that due caution may be used to prevent similar accidents, which is apparent to the jurors may be effected by a collar or ring to prevent the extension of the pipes in future."

*Stamp and Taxes, Nov. 21.* JOHN GREATREX.

LEEDS, Tuesday.—The old lines of railway, as the time approaches for forming a positive opinion of their value, from calculations made, based on the actual traffic for the last fourteen weeks (one of the-old ones, the half year), are beginning to attract the attention of capitalists as well as of speculators. We could point out just at a glance of each line, and in probable working condition, whose dividends will be as much increased at the next half yearly meetings (by the increase of traffic upon a to be explained), as would pay the interest on present sales, and return a very handsome profit for the money; and to each of those that we are in active correspondence with, we have already recommended our clients here for their profit by the to increase (whether yet to be seen. We cannot help pointing attention to one of those lines, which has already arisen and to price to 10 £, within as many days—the same the Manchester and Leeds, now at [illegible], which was only last week at [illegible]. This line will most likely pay 5 per cent. the present half year of all events it will pay 4; and considering the competition with which it is at this time threatened, and the bad effect that extends to its public connection. Turnover a month ago to Leeds that place of the Manchester to the Bradford ring line, for the purpose of enabling the directors to apply for an act this session to extend the line west to Bradford, to Skipton, and thence to Colne, there to meet the Preston and Berwick extension. Mr. Dickens promised, and, as usual, every thing was carried without the slightest opposition. To every friend of the original line the extension shares are to be prized for every fear that is taken. It is fully expected that this measure will [illegible] the price of the old stock, although as a step of any consequence took place in the market for these shares after the meeting. Its quite there and [illegible] to buy [illegible]. Whenever here, since we last wrote, not further business has taken place [illegible] [illegible] [illegible]
